- Suffix Sorting

Philip Bille

Suffix Trees

- String Dictionaries
- Tries
- Suffix Trees
- Suffix Sorting

String Dictionaries

- **String dictionary problem.** Let S be a string of characters from alphabet Σ . Preprocess S into data structure to support:
 - $\text{search}(P)$: Return the starting positions of all occurrences of P in S .
- **Example.**
 - $S = \text{yabbadabbado}$
 - $\text{search(abba)} = \{1,6\}$

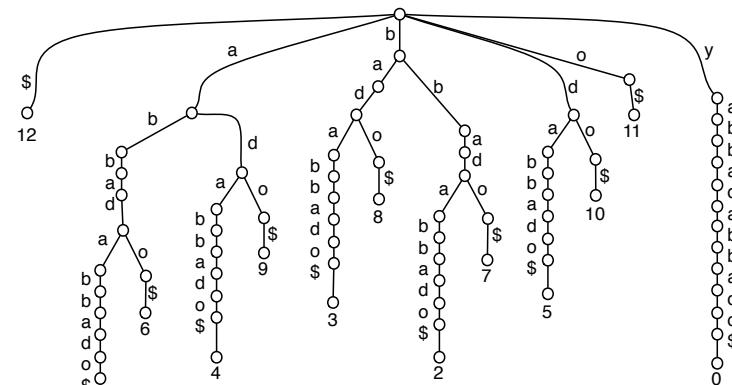

Suffix Trees

- String Dictionaries
- Tries
- Suffix Trees
- Suffix Sorting

Tries

- **Tries [Fredkin 1960].** Retrieval. Store a set of strings in a rooted tree such that:
 - Each edge is labeled by a character. Edges to children of a node are sorted from left-to-right alphabetically.
 - Each root-to-leaf path represents a string in the set. (obtained by concatenating the labels of edges on the path).
 - Common prefixes share same path maximally.
- **Prefix free.**
 - Append special character $\$ < \text{any character in } \Sigma$ to each string.
 - \Rightarrow Each leaf correspond to a unique string.
- **Suffix trie.**
 - Trie of all suffixes of a string.

Tries

- **Space.** $O(n^2)$
- **Preprocessing.** $O(n^2)$

Tries

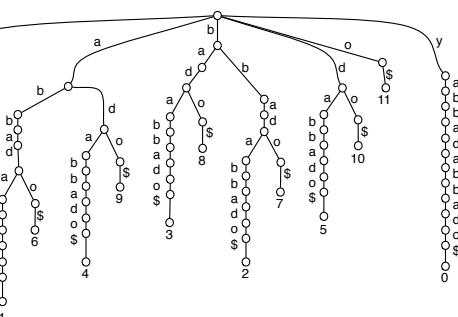

- **Search(P):**
 - Process P from left-to-right while doing top-down search of trie:
 - At each node identify (unique) edge matching next character in P .
 - If no such edge, P is not a substring of S .
 - Report labels of all leaves below final node.

Example.

- $\text{search}(abba) = \{1, 6\}$

Time.

- Top-down search +
- Time for reporting leaves
- $\Rightarrow O(m + occ)$

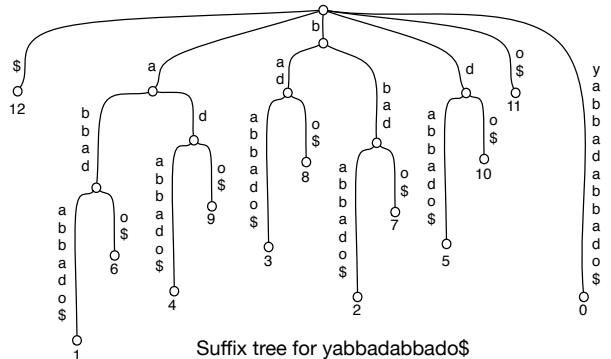

Tries

- **Theorem.** We can solve the string dictionary problem in
 - $O(n^2)$ space and preprocessing time.
 - $O(m + occ)$ time for queries.

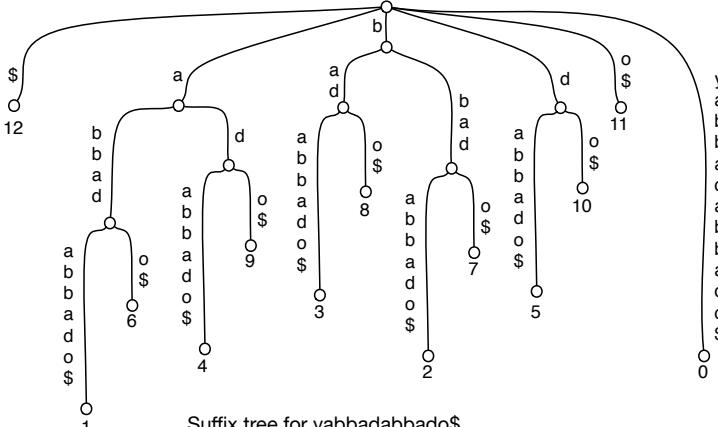

Suffix Trees

- String Dictionaries
 - Tries
 - **Suffix Trees**
 - Suffix Sorting

Suffix Trees

- **Suffix trees.** The **compact trie** of all suffixes of S.
 - Chains of nodes with single child are **compacted** into a single edge.

Suffix Trees

- **Space.**
 - Number of edges + space for edge labels
 - $\Rightarrow O(n)$ space
 - **Preprocessing.** $O(\text{sort}(n, |\Sigma|))$
 - $\text{sort}(n, |\Sigma|) = \text{time to sort } n \text{ characters from an alphabet } \Sigma.$
 - **Search(P):** as before.

- **Theorem.** We can solve the string dictionary problem in
 - $O(n)$ space and $\text{sort}(n, |\Sigma|)$ preprocessing time.
 - $O(m + \text{occ})$ time for queries.

Suffix Trees

- Applications.
 - Approximate string matching problems
 - Compression schemes (Lempel-Ziv family, ...)
 - Repetitive string problems (palindromes, tandem repeats, ...)
 - Information retrieval problems (document retrieval, top-k retrieval, ...)
 - ...

Longest Common Extension

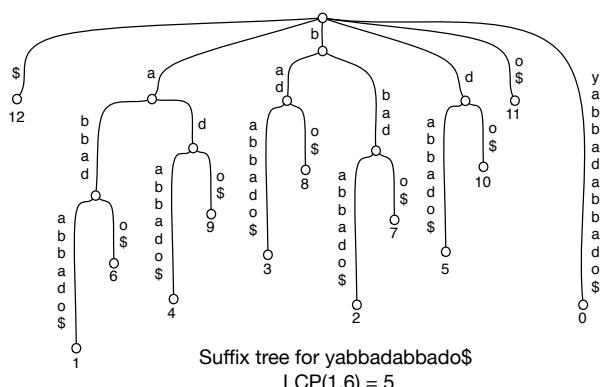

- **Longest common extension problem.** Let S be a string of characters from alphabet Σ . Preprocess S into data structure to support
 - $LCP(i,j)$: Return the length of the longest common prefix of $S[i,n]$ and $S[j,n]$.

yabbadabbado

$LCP(1,6) = 5$

Longest Common Extension

- LCP and suffix trees?
- **Solution.** Suffix tree + string depth of each node + nearest common ancestor data structure.
- $\Rightarrow O(n)$ space and $O(1)$ query time.

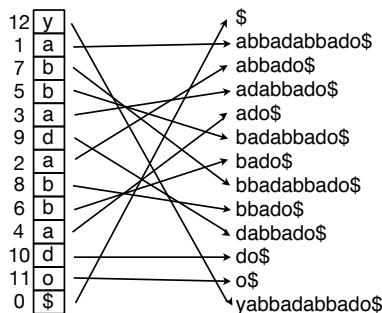

Suffix Trees

- String Dictionaries
- Tries
- Suffix Trees
- Suffix Sorting

Suffix Sorting

- **Suffix sorting.** Given string S of length n over alphabet Σ , compute the sorted **lexicographic order** of all suffixes of S .
- **Theorem [Kasai et al. 2001].** Given the sorted **lexicographic order** of suffixes of S , we can construct the suffix tree for S in linear time.
- How do we sort suffixes?

Suffix Sorting

- **Goal.** Compute the lexicographic order of all suffixes of S fast.
- **Warm up.** Sorting small universes.
- **Solution in 3 steps.**
 - Solution 1: Radix sorting
 - Solution 2: Prefix doubling
 - Solution 3: Difference cover sampling

Sorting Small Universes

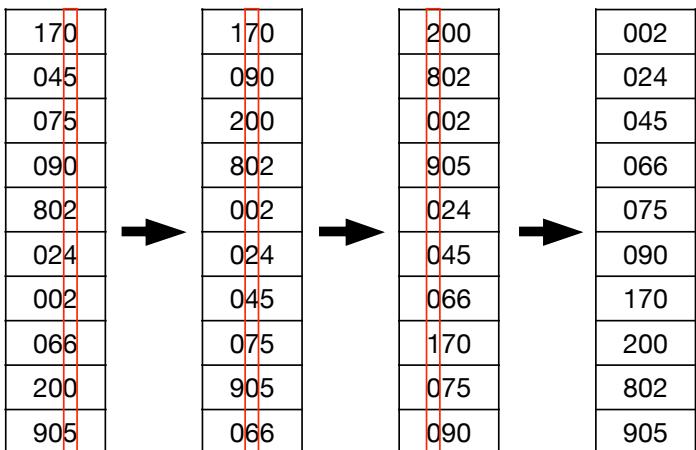

- Let X be a sequence of n integers from a universe $U = \{0, 1, \dots, u-1\}$.
- How fast can we sort if the size of the universe is not too big?
 - $U = \{0, 1\}$?
 - $U = \{0, \dots, n-1\}$?
 - $U = \{0, \dots, n^3 - 1\}$?

Sorting Small Universes

- **Positional number systems.** The **base- n representation** of x is x written in base n .
- **Example.**
 - $(10)_{10} = (1010)_2$ ($1 \cdot 2^3 + 0 \cdot 2^2 + 1 \cdot 2^1 + 0 \cdot 2^0$)
 - $(107)_{10} = (212)_7$ ($2 \cdot 7^2 + 1 \cdot 7^1 + 2 \cdot 7^0$)
- **Radix Sort [Hollerith 1887].** Sort sequence X of n integers from $U = \{0, \dots, n^3 - 1\}$.
 - Write each $x \in X$ as a base n integer (x_1, x_2, x_3) : $x = x_1 \cdot n^2 + x_2 \cdot n + x_3$
 - Sort X according to rightmost (least significant) digit
 - Sort X according to middle digit
 - Sort X according to leftmost (most significant) digit
 - Each sort should be **stable**.
 - Final result is the sorted sequence of X .

Sorting Small Universes

$n = 10, U = \{0, \dots, n^3 - 1 = 999\}$

Sorting Small Universes

- **Theorem.** We can sort n integers from a universe $U = \{0, \dots, n^3 - 1\}$ in $O(n)$ time.

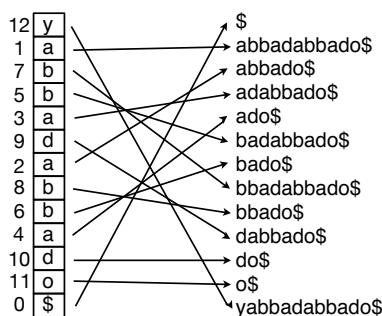

- **Theorem.** We can sort n integers from a universe $U = \{0, \dots, n^k - 1\}$ in $O(kn)$ time.

- Larger universes?

- **Theorem [Han and Thorup 2002].** We can sort n integers in $O(n \log \log n)$ time or $O(n(\log \log n)^{1/2})$ expected time.

Suffix Sorting

- **Suffix sorting.** Given string S of length n over alphabet Σ , compute the sorted lexicographic order of all suffixes of S .
- For simplicity assume $|\Sigma| = O(n)$

Solution 1: Radix Sort

- **Radix Sort.**

- Generate all suffixes (pad with \$).
- Radix sort.

```
yabbadabba$  
abbadabba$  
bbadabba$  
badabba$  
adabbado$  
dabbado$  
ababdado$  
bbabdado$  
bado$  
ado$  
do$  
o$  
$
```

- **Theorem.** We can suffix sort a string of length n in time $O(n^2)$.

Solution 2: Prefix Doubling

- **Prefix doubling [Manber and Myers 1990].** Sort substrings (padded with \$) of lengths 1, 2, 4, 8, ..., n. Each step uses radix sort on pair from previous step.

5	y	8	51	ya	10	84	yabb

0	\$	0	00	\$\$	0	00	\$\$\$\$

- **Theorem.** We can suffix sort a string of length n in time $O(n \log n)$.

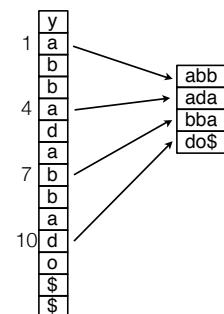

Solution 3: Difference Cover Sampling

- **DC3 Algorithm [Karkkainen et al. 2003].** Sort suffixes in three steps:
 - **Step 1.** Sort sample suffixes.
 - Sample all suffixes starting at positions $i = 1 \bmod 3$ and $i = 2 \bmod 3$.
 - Recursively sort sample suffixes.
 - **Step 2.** Sort non-sample suffixes.
 - Sort the remaining suffixes (starting at positions $i = 0 \bmod 3$).
 - **Step 3.** Merge.
 - Merge sample and non-sample suffixes.

Solution 3: Difference Cover Sampling

- **DC3 Algorithm.** Sort suffixes in three steps:

- **Step 1.** Sort sample suffixes.
 - Sample all suffixes starting at positions $i = 1 \bmod 3$ and $i = 2 \bmod 3$. $O(n)$
 - Recursively sort sample suffixes. $T(2n/3)$
 - **Step 2.** Sort non-sample suffixes.
 - Sort the remaining suffixes (starting at positions $i = 0 \bmod 3$). $O(n)$
 - **Step 3.** Merge.
 - Merge sample and non-sample suffixes. $O(n)$
- $T(n) = \text{time to suffix sort a string of length } n \text{ over alphabet of size } n$
- **Time.** $T(n) = T(2n/3) + O(n) = O(n)$

Solution 3: Difference Cover Sampling

- **Theorem.** We can suffix sort a string of length n over alphabet Σ of size n in time $O(n)$.
- Larger alphabets?
- **Theorem.** We can suffix sort a string of length n over alphabet Σ $O(\text{sort}(n, |\Sigma|))$ time.
- Bound is optimal.
