

k-center

The k-center problem

- **Input.** An integer k and a complete, undirected graph $G=(V,E)$, with distance $d(i,j)$ between each pair of vertices $i,j \in V$.
- d is a metric:
 - $\text{dist}(i,i) = 0$
 - $\text{dist}(i,j) = \text{dist}(j,i)$
 - $\text{dist}(i,l) \leq \text{dist}(i,j) + \text{dist}(j,l)$
- **Goal.** Choose a set $S \subseteq V$, $|S| = k$, of k centers so as to minimize the maximum distance of a vertex to its closest center.

$$S = \operatorname{argmin}_{S \subseteq V, |S|=k} \max_{i \in V} \text{dist}(i,S)$$

- **Covering radius.** Maximum distance of a vertex to its closest center.

- **Covering radius.** Maximum distance of a vertex to its closest center.

k-center: Greedy algorithm

- Greedy algorithm.
 - Pick arbitrary i in V .
 - Set $S = \{i\}$
 - while $|S| < k$ do
 - Find vertex j farthest away from any cluster center in S
 - Add j to S

k-center: Greedy algorithm

- Greedy algorithm.
 - Pick arbitrary i in V .
 - Set $S = \{i\}$
 - while $|S| < k$ do
 - Find vertex j farthest away from any cluster center in S
 - Add j to S

k-center: Greedy algorithm

- Greedy algorithm.
 - Pick arbitrary i in V .

k-center: Greedy algorithm

- Greedy algorithm.
 - Pick arbitrary i in V .
 - Set $S = \{i\}$
 - while $|S| < k$ do
 - Find vertex j farthest away from any cluster center in S
 - Add j to S

- Greedy is a 2-approximation algorithm:
 - polynomial time ✓
 - valid solution ✓
 - factor 2

k-center: analysis greedy algorithm

- r^* optimal radius.
- Show all vertices within distance $2r^*$ from a center.
- Consider optimal clusters. 2 cases.
 - Algorithm picked one center in each optimal cluster
 - distance from any vertex to its closest center $\leq 2r^*$ (triangle inequality)

- Some optimal cluster does not have a center.
 - Some cluster have more than one center.
 - distance between these two centers $\leq 2r^*$.
 - when second center in same cluster picked it was the vertex farthest away from any center.
 - distance from any vertex to its closest center at most $2r^*$.

k-center

Bottleneck algorithm

- Assume we know the optimum covering radius r .
- Bottleneck algorithm.
 - Set $R := V$ and $S := \emptyset$.
 - while $R \neq \emptyset$ do
 - Pick arbitrary i in R .
 - Add j to S
 - Remove all vertices with $d(j,v) \leq 2r$ from R .

- Example: $k=3$. $r=4$.

Bottleneck algorithm

- Example: $k=3$. $r=4$.

Analysis bottleneck algorithm

- r^* optimal radius.
- Covering radius is at most $2r^*$.
- Show that: We cannot pick more than k centers:
 - We can pick at most one in each optimal cluster:
 - Distance between two nodes in same optimal cluster $\leq 2r^*$
 - When we pick a center in a optimal cluster all nodes in same optimal cluster is removed.

Analysis bottleneck algorithm

- r^* optimal radius.
- Can use algorithm to “guess” r^* (at most n^2 values).
- If algorithm picked more than k centers then $r^* > r$.
 - If algorithm picked more than k centers then it picked more than one in some optimal cluster.
 - Distance between two nodes in same optimal cluster $\leq 2r^*$.
 - If more than one in some optimal cluster then $2r < 2r^*$.

Bottleneck algorithm

- Assume we know the optimum covering radius r .
- Example: $k=3$. $r^* = 4$.
- Try with $r=2$:

Bottleneck algorithm

- Assume we know the optimum covering radius r .
- Example: $k=3$. $r^* = 4$.
- Try with $r=2$:

Set cover

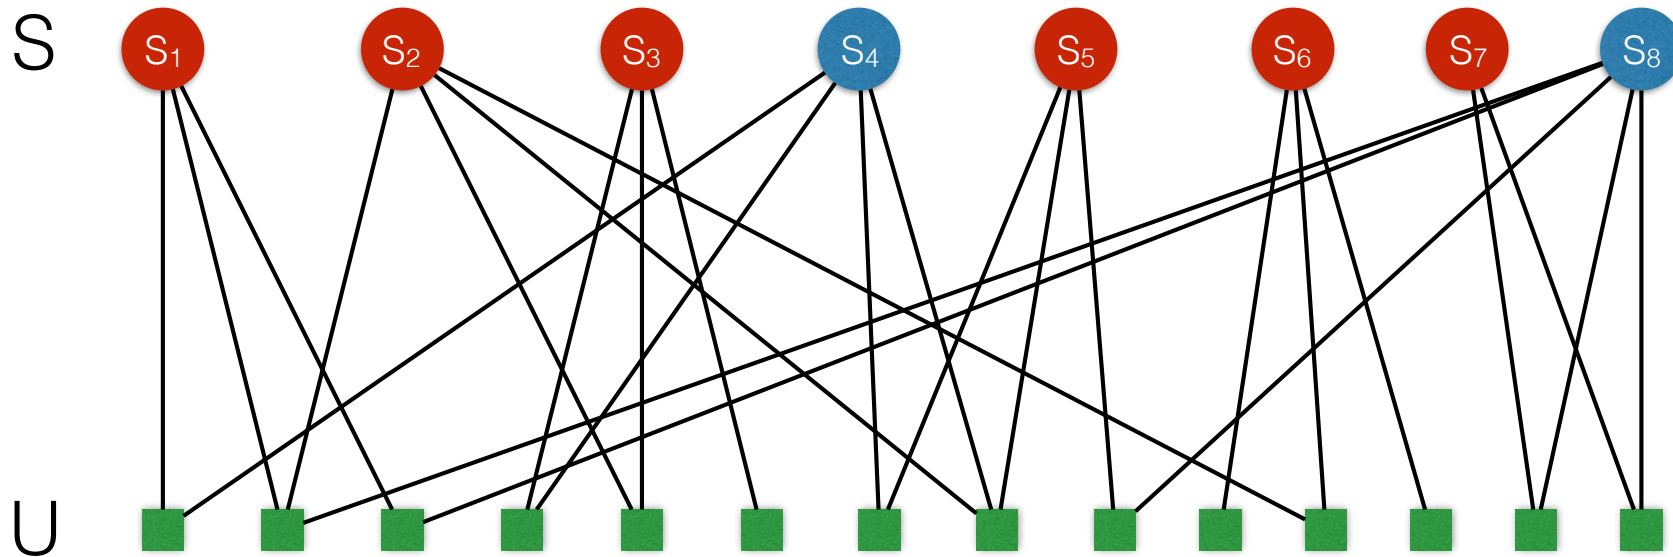

Set cover problem

- Set U of n elements.
- Subsets of U : S_1, \dots, S_m .
- Each set S_i has a weight $w_i \geq 0$.
- **Set cover.** A collection of subsets C whose union is equal to U .
- **Goal.** find set cover of minimum weight.

Set cover: greedy algorithm

Greedy-set-cover

Set $R := U$ and $C := \emptyset$

while $R \neq \emptyset$

Select the set S_i minimizing $\frac{w_i}{|S_i \cap R|}$

Delete the elements from S_i from R .

Add S_i to C .

endwhile

Return C .
