Testing random number generaters

- Theoretical tests/properties
- Tests for uniformity
- Tests for independence

DTU

## Characteristics of random number generators

**Definition:** A sequence of *pseudo-random* numbers  $U_i$  is a deterministic sequence of numbers in ]0, 1[ having the same relevant statistical properties as a sequence of random numbers.

The question is what are relevant statistical properties.

• Distribution type

• Randomness (independence, whiteness)

 $\mathbf{D}$ 

### Theoretical tests/properties

DTU

- Test of global behaviour (entire cycles)
- Mathematical theorems
- Typically investigates multidimensional uniformity

Testing random number generators

- Test for distribution type
  - Visual tests/plots
  - $\diamond \ \chi^2 \ {\rm test}$
  - Kolmogorov Smirnov test
- Test for independence
  - Visual tests/plots
  - ♦ Run test up/down
  - Run test length of runs
  - Test of correlation coefficients

DH

#### Significance test

DH

- We assume (known) model *The hypothesis*
- We identify a certain characterising random variable *The test statistic*
- We reject the hypothesis if the test statistic is an abnormal observation under the hypothesis

#### Key terms

- Hypothesis/Alternative
- Test statistic
- Significance level
- Accept/Critical area
- Power
- *p*-value

DTU

7

#### Multinomial distribution

- *n* items
- k classes
- each item falls in class j with probability  $p_j$
- $X_j$  is the (random) number of items in class j

• We write 
$$\mathbf{X} = (X_1, \dots, X_2) \sim \operatorname{Mul}(n, p_1, \dots, p_k)$$
  
Thus  $X_j \sim \operatorname{Bin}(n, p_j) \operatorname{E}(X_j) = np_j, \operatorname{Var}(X_j) = np_j(1 - p_j)$   
And  $\operatorname{E}\left(\frac{X_j - np_j}{\sqrt{np_j(1 - p_j)}}\right) = 0$   $\operatorname{Var}\left(\frac{X_j - np_j}{\sqrt{np_j(1 - p_j)}}\right) = 1$   
Thus  $\frac{X_j - np_j}{\sqrt{np_j(1 - p_j)}} \stackrel{n \to \infty}{\sim} \operatorname{N}(0, 1)$ 

DTU

 $\Xi$ 

DTU

8

# Test statistic for k - 2Recall $\frac{X_j - np_j}{\sqrt{np_j(1-p_j)}} \stackrel{n \to \infty}{\sim} N(0,1)$ thus $\left(\frac{X_j - np_j}{\sqrt{np_j(1-p_j)}}\right)^2 = \frac{(X_j - np_j)^2}{np_j(1-p_j)} \stackrel{asymp}{\sim} \chi^2(1)$

Consider now the case 
$$k = 2$$

$$\frac{(X_1 - np_1)^2}{np_1(1 - p_1)} = \frac{(X_1 - np_1)^2(p_1 + 1 - p_1)}{np_1(1 - p_1)} = \frac{(X_1 - np_1)^2}{np_1} + \frac{(X_1 - np_1)^2}{n(1 - p_1)}$$
$$= \frac{(X_1 - np_1)^2}{np_1} + \frac{(X_1 - n - n(p_1 - 1))^2}{n(1 - p_1)} = \frac{(X_1 - np_1)^2}{np_1} + \frac{(-X_2 + np_2)^2}{np_2}$$
$$= \frac{(X_1 - np_1)^2}{np_1} + \frac{(X_2 - np_2)^2}{np_2}$$

• the  $\chi^2$  statistic

• the proof can be completed by induction

DTU

DIU

Test for distribution type  $\chi^2$  test

DTU

The general form of the test statistic is

$$T = \sum_{i=1}^{n} \frac{(n_{\text{observed},i} - n_{\text{expected},i})^2}{n_{\text{expected},i}}$$

- The test statistic is to be evaluated with a  $\chi^2$  distribution with df degrees of freedom. df is generally  $n_{\text{classes}} 1 m$  where m is the number of estimated parameters.
- It is recommend to choose all groups such that  $n_{\text{expected},i} \ge 5$

DIU

# Test for distribution type Kolmogorov Smirn

- Compare empirical distribution function F<sub>n</sub>(x) with hypothesized distribution F(x).
- For known parameters the test statistic does not depend on  ${\cal F}(x)$
- Better power than the  $\chi^2$  test
- No grouping considerations needed
- Works only for completely specified distributions in the original version

DH

#### **Empirical distribution**

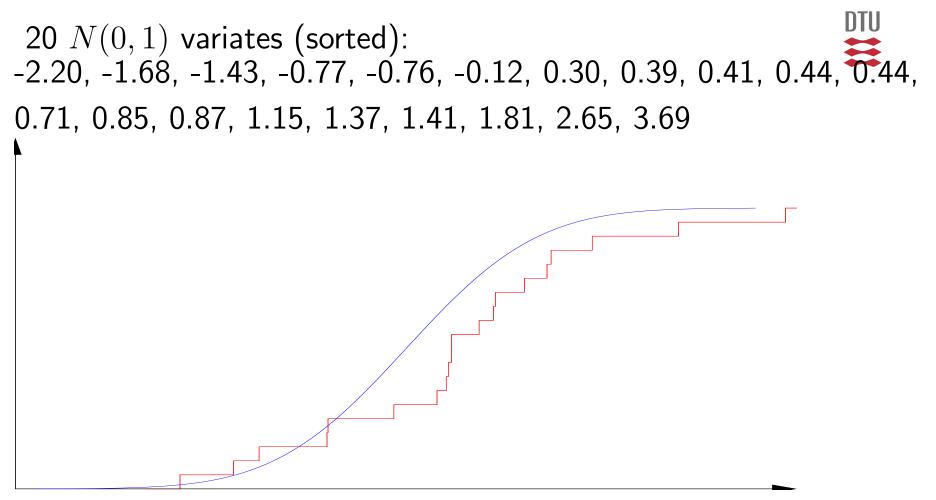

20 N(0,1) variates (sorted): -2.20, -1.68, -1.43, -0.77, -0.76, -0.12, 0.30, 0.39, 0.41, 0.44, 0.44, 0.71, 0.85, 0.87, 1.15, 1.37, 1.41, 1.81, 2.65, 3.69

 $X_i$  iid random variables with  $F(x) = \mathsf{P}(X \le x)$ 

Each leads to a (simple) random function  $F_{e,i}(x) = \mathbf{1}_{\{\mathbf{X}_i \leq \mathbf{x}\}}$ leading to  $F_e(x) = \frac{1}{n} \sum_{i=1}^n F_{e,i}(x) = \frac{1}{n} \sum_{i=1}^n \mathbf{1}_{\{\mathbf{X}_i \leq \mathbf{x}\}}$  $\mathsf{E}(F_e(x)) = \mathsf{E}\left(\frac{1}{n} \sum_{i=1}^n \mathbf{1}_{\{\mathbf{X}_i \leq \mathbf{x}\}}\right) = \frac{1}{n} \sum_{i=1}^n \mathsf{E}\left(\mathbf{1}_{\{\mathbf{X}_i \leq \mathbf{x}\}}\right) = F(x)$  $\mathsf{Var}(F_e(x)) = \frac{1}{n^2} n F(x)(1 - F(x)) = \frac{F(x)G(x)}{n}$  $F_e(x) \stackrel{n \to \infty}{\sim} \mathsf{N}\left(F(x), \frac{F(x)G(x)}{n}\right)$ In the limit  $(n \to \infty)$  we have a random continuous function of x -

In the limit  $(n \to \infty)$  we have a random continuous function of x a stochastic process, more particularly a Brownian bridge  $\frac{1}{12}$ 

#### **Empirical distribution**

$$D_n = \sup_x \{ |F_n(x) - F(x)| \}$$

the test statistic follows Kolmogorovs distribution

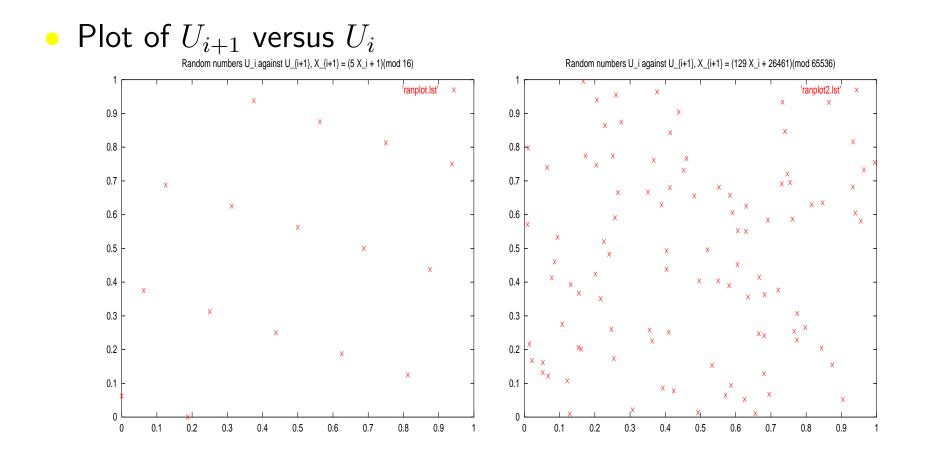

#### Test statistic and significance levels

			Level of significance $(1 - \alpha)$			
Case	Adjusted test statistic	0.850	0.900	0.950	0.975	0.990
All parameters known	$\left(\sqrt{n} + 0.12 + \frac{0.11}{\sqrt{n}}\right) D_n$	1.138	1.224	1.358	1.480	1.628
$N(\bar{X}(n),S^2(n))$	$\left(\sqrt{n} - 0.01 + \frac{0.85}{\sqrt{n}}\right) D_n$	0.775	0.819	0.895	0.955	1.035
$\exp(ar{X}(n))$	$\left(\sqrt{n} + 0.26 + \frac{0.5}{\sqrt{n}}\right)\left(D_n - \frac{0.2}{n}\right)$	0.926	0.990	1.094	1.190	1.308

#### Test for correlation - Visual tests

15

DTU

## Indepedence test: Test for multidimensional 🚆 uniformity

• In the two dimensional version test for uniformity of  $(U_{2i-1}, U_{2i})$ 

DIU

16

- Typically  $\chi^2$  test
- The number of groups increases drastically with dimension

#### Run test I Above/below

DTU

- The Wald-Wolfowitz run test, can be used by e.g. comparing with the median.
- The number of runs (above/below the median) is (asymptotically) distributed as

$$\mathsf{N}\left(2\frac{n_1n_2}{n_1+n_2}+1, 2\frac{n_1n_2(2n_1n_2-n_1-n_2)}{(n_1+n_2)^2(n_1+n_2-1)}\right)$$

where  $n_1$  is the number of samples above and  $n_2$  is the number below.

DIU

17

• The test statistic is the total number of runs  $T = R_a + R_b$  with  $R_a$  (runs above) and  $R_b$  (runs below)

## Run tests II

#### **Up/Down from Knuth**

A test specifically designed for testing random number generators is the following UP/DOWN run test, see e.g. Donald E. Knuth, The Art of Computer Programming Volume 2, 1998, pp. 66-.

The sequence:

0.54, 0.67, |0.13, 0.89, |0.33, 0.45, 0.90, |0.01, 0.45, 0.76, 0.82, |0.24, |0.17, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.13, 0.45, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, 0.90, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, 0.15, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14, |0.14,

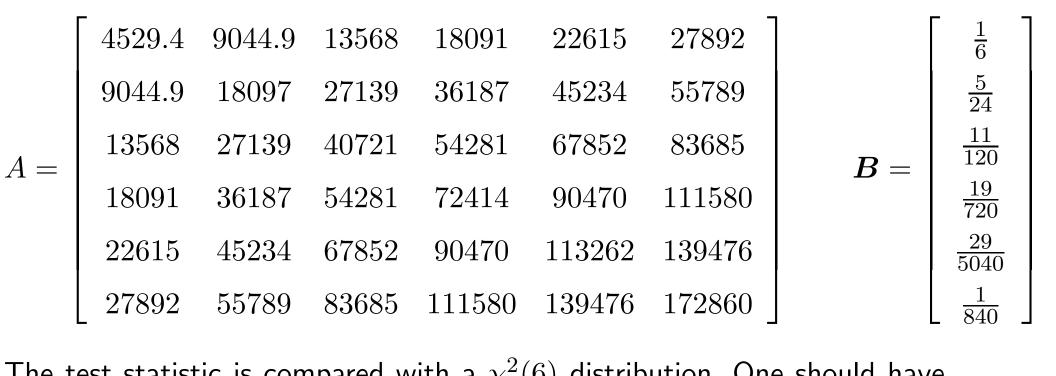

has runs of length 2,2,3,4,1, ... i.e. runs of consecutively increasing numbers.

DIU

#### Run test II

Generate *n* random numbers. The observed number of runs of the length  $1, \ldots, 5$  and  $\geq 6$  are recorded in the vector  $\mathbf{R}$ . The test statistic is calculated by:

$$Z = \frac{1}{n-6} (\boldsymbol{R} - n\boldsymbol{B})^T A (\boldsymbol{R} - n\boldsymbol{B})$$

The test statistic is compared with a  $\chi^2(6)$  distribution. One should have n>4000

#### Run test III

()

20

**The-Up-and-Down Test** This test is described in Rubinstein 81 "Simulation and the Monte Carlo Method" and Iversen 07 (in Danish).

The sequence:

0.54, 0.67, 0.13, 0.89, 0.33, 0.45, 0.90, 0.01, 0.45, 0.76, 0.82, 0.24, 0.17 is converted to

<,>,<,>,<,>,<,<,>,>

giving in total 8 runs of length 1, 1, 1, 1, 2, 1, 3, 2

#### Run test III

The expected number of runs of length k is  $\frac{n+1}{12}$ ,  $\frac{11n-4}{12}$  for runs of length 1 and 2 respectively, and

$$\frac{2[(k^2+3k+1)n-(k^3+3k^2-k-4)]}{(k+3)!}$$

for runs of length k < N - 1.

Define X to be the total number of runs, then

$$Z = \frac{X - \frac{2n-1}{3}}{\sqrt{\frac{16n-29}{90}}}$$

is asymptotically N(0,1).

DH

#### Correlation coefficients

• the estimated correlation

$$c_h = \frac{1}{n-h} \sum_{i=1}^{n-h} U_i U_{i+h} \sim \mathsf{N}\left(0.25, \frac{7}{144n}\right)$$

DTU

#### Exercise 1

In this exercise you should implement everything including the tests (e.g. the chi-square and KS tests) yourself. Later, when your code is working you are free to use builtin functions.

- Write a program implementing a linear congruential generator (LCG). Be sure that the program works correctly using only integer representation.
  - (a) Generate 10.000 (pseudo-) random numbers and present these numbers in a histogramme (e.g. 10 classes).
  - (b) Evaluate the quality of the generator by graphical descriptive statistics (histogrammes, scatter plots) and statistical tests  $\chi^2$ ,Kolmogorov-Smirnov, run-tests, and correlation test.
  - (c) Repeat (a) and (b) by experimenting with different values of "a", "b" and "M". In the end you should have a decent generator. Report at least one bad and your final choice.

- 2. Apply a system available generator and perform the various statistical tests you did under Part 1 point (b) for this generator too.
- 3. You were asked to simulate one sample and perform tests on this sample. Discuss the sufficiency of this approach and take action, if needed.
