Classical planning on one slide:

- **Given:**
 - Initial world **state**
 - **Goal** description
 - Available **actions**
- **Wanted:**
 - **Plan** leading from initial state to goal state
- **Assumptions:**
 - Single agent
 - Full observability
 - Deterministic actions
 - Static and discrete environment
 - Reachability goal
 - ...

Theoretical Background

Cooperative Epistemic Planning

Agent Types and Plan Executions

Conclusion

Algorithmic techniques successful in (satisficing) classical planning:

Mainly **state-space search**

- **guided by goal-distance heuristics**
- **based on delete relaxation,**
- **abstractions, and**
- **landmarks,**
- **enhanced with pruning techniques**
(helpful actions, commutativity, symmetry),
- **as well as invariants, causal relationships,**
decoupling techniques, . . .

Motivation

Epistemic Planning

Example:
Application
Scenario

Theoretical
Background

Cooperative
Epistemic
Planning

Agent Types
and Plan
Executions

Conclusion

- **Question:** How well do they serve us in epistemic planning?
- **Attempt at answer:**
 - Start with simple state-space search.
 - Later try to add in other techniques step by step.
 - **Contrast:** Compilation to classical planning (cf. Muise, Belle, McIlraith, et al.).

Theoretical Background

Cooperative
Epistemic
Planning

Agent Types
and Plan
Executions

Conclusion

- **Epistemic planning** useful if we want the agents to coordinate implicitly

Cooperative epistemic planning:

- **Task:** Collaboratively reach joint goal
- **Challenge:** Required **knowledge and capabilities distributed** among agents
- **Idea:** Communication / coordination as part of the plan

Motivation

Executions

Conclusion

Action application and successor states defined using **product update**.

For epistemic state s and epistemic action a , the product update $s \otimes a$ is the product of the two Kripke structures, with

- world-event pairs (w, e) eliminated if the precondition of e is violated in w and
- the valuation function updated according to the postcondition function.

Conclusion

A cooperative epistemic planning problem $\Pi = \langle s_0, A, \omega, \gamma \rangle$ consists of

- an initial epistemic state s_0 ,
- a finite, set A of epistemic actions,
- an owner function ω assigning agents to actions, and
- a goal formula γ such that each action a is local for $\omega(a)$.

The action set is common knowledge among all agents.

and Plan
Executions

Conclusion

Implicitly Coordinated Plans

Example (ctd.):

action	owner	pre	post	observability
...
<i>tellP</i>	1	<i>p</i>	\top	$tellP = \odot e_1 : \langle p, \top \rangle$

Let $s_1 = s_0 \otimes setP$, $s_2 = s_1 \otimes tellP$, and $s_3 = s_2 \otimes setR$. Then

state	remark
$s_1 = \begin{array}{ccc} \odot & \xrightarrow{2} & \bullet \\ (w_1, e_1) : p & & (w_1, e_2) : q \end{array}$	$s_1 \models p$, but $s_1 \not\models K_2 p$. <i>2 does not know he can apply setR.</i>
$s_2 = \begin{array}{c} \odot \\ (w_1, e_1, e_1) : p \end{array}$	$s_2 \models p$, and $s_2 \models K_2 p$. <i>2 now knows that he can apply setR.</i>
$s_3 = \odot (w_1, e_1, e_1, e_1) : p, r$	$s_3 \models r$. Goal is achieved.

Motivation

Theoretical
Background

Cooperative
Epistemic
Planning

Planning Tasks

Sequential
Planning

Conditional
Planning

Agent Types
and Plan
Executions

Conclusion

More formally:

- $s_0 \models K_1((setP))K_1((tellP))K_2((setR))r$
- $(setP, tellP, setR)$ is an implicitly coordinated plan for Π .

Motivation

Theoretical
Background

Cooperative
Epistemic
Planning

Planning Tasks

Sequential
Planning

Conditional
Planning

Agent Types
and Plan
Executions

Conclusion

Searching for implicitly coordinated plans:

- Forward search in space of epistemic states using product update.
- In each step, perform a **perspective shift** to the agent whose action is considered, by considering its **associated local state**.

Motivation

Theoretical
Background

Cooperative
Epistemic
Planning

Planning Tasks

Sequential
Planning

Conditional
Planning

Agent Types
and Plan
Executions

Conclusion

Conditional plans:

- Often, sequential plans are not sufficient to solve a task.
- One can also apply an AND-OR search to find **conditional** (branching) plans.

Agent Types
and Plan
Executions

Conclusion

Conditional plans:

- Often, sequential plans are not sufficient to solve a task.
- One can also apply an AND-OR search to find **conditional** (branching) plans.

Remark:

- Needed, e.g., to solve Russian card games problem (initial state uncertainty necessitates branching)

Implicitly Coordinated Conditional Plans

The Russian Card Game Problem

Seven cards
randomly dealt to
Alice, Bob & Eve:

Alice:

Goal: Inform each other about their
hands using **public announcements**
without informing Eve

Bob:

Eve:

Conclusion

AND-OR Search

- AND: Solve an arbitrary state (\mathcal{M}, W_d) by solving all global states (\mathcal{M}, w) with $w \in W_d$
- OR: Solve a global state (\mathcal{M}, w) by finding an agent i and an action a with $\omega(a) = i$, and solving $(\mathcal{M}, w)^i \otimes a$

Global policy

- $\pi((\mathcal{M}, \{w_1\})) = \{a_1\}$ with $\omega(a_1) = 1$
- $\pi((\mathcal{M}, \{w_3\})) = \{a_2\}$ with $\omega(a_2) = 2$
- $\pi((\mathcal{M}, \{w_2\})) = \{a_1, a_2\}$

Conditional Planning

Agent Types and Plan Executions

Conclusion

- Each agent plans and decides for himself when/how to act
 - No imposed agent/action precedence:
First agent that decides to act updates the system
- ⇒ Agents may have to replan.

Executions

Conclusion

An agent is called **lazy** if he chooses **another agents' action** whenever allowed (= it is part of a strong policy).

Example problem: Who gets the door?

The goal, for Jim and John, is to go to the door and let Sarah in. Both agents are perfectly capable of doing so in one action.

What happens if both agents are lazy?

Executions

Conclusion

An agent is called **naively eager** if he chooses **an action owned by himself** whenever allowed (= it is part of a strong policy).

Example problem: Pulling the lever (I)

The goal, for **Lewis** and **Ralph**, is to pull the lever either fully to the left (-2), or to the right (2). Lewis can only pull left while Ralph can only pull right (both in steps of 1).

What happens if both agents are naively eager?

Executions

Conclusion

An agent is called **intelligently eager** if he chooses **an action owned by himself** whenever this action is part of a strong policy of **minimal depth**.

Example problem: Pulling the lever (II)

Same problem as before, but **Lewis** only knows about -2 being a goal position, while **Ralph** only knows about 2 being one.

Conclusion

What happens if both agents are intelligently eager?

A More Interesting Problem...

(robot icons made by Freepik and SimpleIcon from www.flaticon.com)

- Round and Square Robot have to pass each other.
- The corridor is narrow, only one agent per cell is allowed.
- Each agent is uncertain about the other's destination.

Executions

Conclusion

- When do we need which communicative actions?
- What about meta-reasoning?

Summary:

- Synthesis of epistemic plans/strategies
- Centralized vs. **implicitly coordinated** planning
- Communication modeled as epistemic actions
- Coordination becomes part of the plan
- Relies on the agents' ability to shift perspective
