Program Models and Semi-Public Environments

D. Grossi, W. van der Hoek, C. Moyzes, M. Wooldridge

To Be Announced! Synthesis of Epistemic Protocols Lorentz Center 17-21 August 2015

- A computation (possibly non-deterministic) is executed publicly. Intuitively "One of the deterministic programs $\pi_1, \pi_2, \ldots, \pi_n$ will be randomly executed" is announced.
- Data is distributed privately, in the sense that not all agents are able to see the value of all variables.

Vision is the agent's way to 'break' some (or all) of the non-determinism involved.

In the intersection of at least three research areas.

• Interpreted systems:

 $\label{eq:linear} \mbox{Interpreted Systems / Epistemic Model} = \mbox{Vision / Program Model}$

Oynamic Logic:

DL has tests & assignments as basic programs, and non-deterministic choice, sequential composition, iteration, as a way to combine them. It is also a way to study *ontic* change.

• Dynamic Epistemic Logic:

Program models are a modification of action models. Used for *epistemic* change.

• Language:

$$Ag = \{1, \dots, m\}, Var = \{x_1, \dots, x_n\}$$

$$\begin{split} \mathsf{M}_{\pi}, \mathsf{w} & ::= \ \mathsf{M}_{!\varphi_{0}}, \mathsf{e} \mid \mathsf{M}_{\updownarrow x}, \mathsf{a} \mid (\mathsf{M}_{\pi} \cup \mathsf{M}_{\pi}), \mathsf{w} \mid (\mathsf{M}_{\pi}; \mathsf{M}_{\pi}), \mathsf{w} \\ \varphi & ::= \ \top \mid x_{j} \mid V_{i}x_{j} \mid \neg \varphi \mid \varphi \land \varphi \mid [\mathsf{M}, \mathsf{w}]\varphi \mid K_{i}\varphi \end{split}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 $V_i x_j$ is to express that agent i 'sees' variable x_j .

Epistemic Model:

$$M = \langle W, R, V, f \rangle$$
, where

- W is a finite (possibly empty) set of states;
- 2 $f: W \to \Theta$ assigns a valuation θ to each state in W;
- $\label{eq:V} \mathbf{0} ~ V: Ag \to 2^{Var} \text{ keeps track of the variables that agent } i \text{ `can see';}$

• $R: Ag \to 2^{(W \times W)}$ assigns an accessibility relation to each agent $i \in Ag$. Each R(i) is an equivalence relation.

We define $\mathcal{A}^- = \mathcal{A} \setminus \{\bot\}$, where \mathcal{A} is the carrier set of the Lindenbaum-Tarski algebra of \mathcal{L}_0 (the propositional language).

Program Point

An element $w = (pre(w), tgl(w)) \in \mathcal{A}^- \times \mathcal{P}(Var)$ is called a *program point*.

Program Model

Any finite set of program points M is called a program model.

For all
$$u, w \in M$$
: $w \approx_i^V u$ iff $(tgl(w) \triangle tgl(u)) \cap V(i) = \emptyset$

Model product

Let $M = \langle W, R, V, f \rangle$ be an epistemic model, and M be a program model. $(M \times M)$ is the epistemic model $M' = \langle W', R', V', f' \rangle$ defined as follows: **1** $W' = \{(w, w) \mid w \in W, w \in M \& (M, w) \models pre(w)\};$ **2** $(w, w)R'_i(u, u)$ iff wR_iu and $w \approx^V_i u;$ **3** V' = V;**4** $f'((w, w)) = \updownarrow (tgl)(w)(f(w)).$

The logic of Semi-Public Environments (V)

• Truth definition for $[M, w]\varphi$ $(M, w) \models [M, w]\varphi$ iff $(M, w) \llbracket M, w \rrbracket (M', w')$ implies $(M', w') \models \varphi$

•
$$(M, w) \llbracket M, w \rrbracket (M', w')$$
 iff

 $(M,w)\models pre(\mathsf{w}) \text{ and } (M',w')=(M\times\mathsf{M},(w,\mathsf{w}))$

- $\mathsf{M}_{!\varphi_0} = (\varphi_0, \emptyset)$
- $\mathsf{M}_{\updownarrow x} = (\top, \{x\})$
- $\mathsf{M}_{\pi_1\cup\pi_2} = \mathsf{M}_{\pi_1}\cup\mathsf{M}_{\pi_2}$

In contrast to PDL and DEL $\not\models ([\pi_1]\varphi_1 \land [\pi_2]\varphi_2) \rightarrow [\pi_1 \cup \pi_2](\varphi_1 \lor \varphi_2)$

• $M_{\pi_1;\pi_2} = \{ w \in \mathcal{A}^- \times \mathcal{P}(Var) \mid \exists w_1 \in M_{\pi_1}, w_2 \in M_{\pi_2} \text{ such that} pre(w) = pre(w_1) \land \updownarrow (tgl(w_1))(pre(w_2)) \& tgl(w) = tgl(w_1) \triangle tgl(w_2) \}$

Again note that $[\pi_1; \pi_2] \varphi \not\equiv [\pi_1] [\pi_2] \varphi$.

Propositional Component

 φ

Epistemic Component

$$V_i x \to (K_i x \vee K_i \neg x)$$

$$V_i x \to K_j V_i x$$

$$K_i (\varphi \to \psi) \to (K_i \varphi \to K_i \psi)$$

$$K_i \varphi \to \varphi$$

$$K_i \varphi \to K_i K_i \varphi$$

$$\neg K_i \varphi \to K_i \neg K_i \varphi$$

$\begin{array}{l} \hline \textbf{Rules of Inference} \\ \textbf{if} \ \vdash \phi \ \textbf{and} \ \vdash (\phi \rightarrow \psi) \ \textbf{then} \ \vdash \psi \\ \textbf{if} \ \vdash \phi \ \textbf{then} \ \vdash K_i \phi \\ \textbf{if} \ \vdash \phi \ \textbf{then} \ \vdash [\textbf{M}, \textbf{w}] \phi \\ \textbf{if} \ \vdash \psi_1 \leftrightarrow \psi_2 \ \textbf{then} \ \vdash \varphi[\psi_1/\psi] \leftrightarrow [\psi_2/\psi] \end{array}$

if φ is a prop. tautology

Expanding the setting of Semi-Public Environments

- Infinite domain for the variables, e.g., natural numbers.
- Programs that change the agents vision.
- Higher order vision; i sees that j sees variable x.
- Preconditions that are not necessarily propositional.
- Vision not just of variables but more complex formulas.
- Changing the fact that vision is common knowledge.
- Changing the fact that the program executed is common knowledge.

• Introducing the notion that programs are executed by someone within the system, i.e., an agent.

• Given a well-specified epistemic state as input, and a desirable epistemic-state as output, what is the process of transforming the input into the output?

• Sequential Composition works catalytically.

Thank You!
