**A First “Final” Draft**

# **Transport**

## **A Domain Description**

**Dines Bjørner**

**June 12, 2025: 16:47**

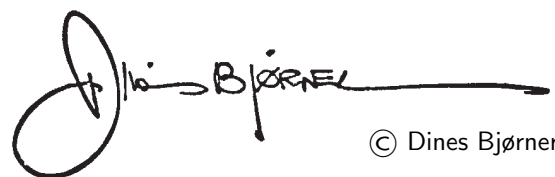

- **Warning:** Many formulas need being type checked, etc., etc. !
  
- I began writing this document February 22, 2025.
- In my 87th year !
- I think about it and write “on” it, every day 7/7.
- Often twice a a day, 1-2 hours.
- More than that – and I get tired.
  
- **A first draft June 10, 2025.**
  - Now, as from June 10, 2025, I will
    - \* Go through the entire document.
    - \* Check that all index references to formulas are “correct” .
    - \* Etcetera, et cetera !
  - I will release this and forthcoming versions to the Internet:
 

<https://www.imm.dtu.dk/~dibj/2025/transport/main.pdf>
  
- Section A.3 (pages 133–141) presents an index to all formulas !
- You may find, in the version of this report, that You are now perusing, that there are some “mysterious” vertical [i.e., line] spacing.  
 They are there in order for the index entries to refer to pages ( $\pi$ ) where both the (item  $\iota$ ) enumerated narrative and formal entries are on the same page !
  
- Pls. see Sect. 26.4 on page 126.
- Pls. refer to Appendix Chapter B on page 143 for a summary of main formal entities.

## Prelude

This is an engineering report.

We analyze and describe a conceptual domain of *transport* in all its forms: passenger and goods, road, rail, water (navigable rivers and lakes as well as the open sea), and air. From the basis of an abstract notion of *graphs* with *labeled nodes* and *edges*, we define a notion of *routes of graphs*: sequences of node and edge labels. Nodes are then interpreted as street intersections, bus stops, railway stations, harbours and airports and edges as links between neighbouring nodes: street segments, bus routes, rail lines, sea lanes, and air routes. And from there it goes! We expand the treatment to cover customers, [sending and receiving] merchandises, conveyor companies and logistics companies.

A handwritten signature in black ink, consisting of a large, stylized initial 'D' followed by the name 'Bjørner' in a cursive script.

# Chapter 1

## Introduction

### The Triptych Dogma

In order to *specify software*,  
we must understand its requirements.

In order to *prescribe requirements*,  
we must understand the *domain*.

So we must *study, analyze and describe* domains.

This is one of a series, [10, 16, 15, 14, 8], of domain studies of such infrastructure components as government, public utilities, banking, transport, insurance, health care, etc. The current, this ‘Introduction’ chapter is common to these study reports.

### 1.1 On A Notion of ‘Infrastructure’

Central to our effort of studying “man-made” domains is the notion of *infrastructure*<sup>1</sup>. The *infrastructure* can be characterized as follows: *the basic physical and organizational structures and facilities (e.g. buildings, roads, power supplies) needed for the operation of a society or enterprise*, “the social and economic infrastructure of a country”. We interpret the “for example, e.g.,” to include, some already mentioned above: government structure: legislative, executive & judicial units, transport: roads, navigable rivers and lakes, the open sea, banking, educational system, health care, utilities: water, electricity, telecommunications (e.g. the Internet) gas, , etc.,<sup>2</sup> Also: Winston Churchill is quoted to have said in the House of Commons: “*The young Labour speaker we have just listened to wants clearly impressing his constituency with the fact that he went to Eton and Oxford since he now uses such modern terms as ‘infrastructure’*”.

### 1.2 Domain Models

We rely on [12, 9, 7, 6, 4]. They provide a scientific foundation for modelling domains in the style of this report.

#### 1.2.1 Some Characterizations

**Domain:** By a *domain* we shall understand a *rationaly describable* segment of a *manifest*<sup>3</sup>, *discrete dynamics* fragment of a *human assisted* reality: the world that we daily observe – in which we work and act, a reality made significant by human-created entities. The domain embody *endurants* and *perdurants*.

**Endurants:** By *endurants* we mean those quantities of domains that we can observe (see and touch), in *space*, as “complete” entities at no matter which point in *time* – “material” entities that persists, endures – capable of enduring adversity, severity, or hardship [Merriam Webster].

---

<sup>1</sup><https://en.wikipedia.org/wiki/Infrastructure>

<sup>2</sup> According to the World Bank, ‘infrastructure’ is an umbrella term for many activities referred to as ‘social overhead capital’ by some development economists, and encompasses activities that share technical and economic features (such as economies of scale and spill-overs from users to non-users). We take a more technical view, and see infrastructures as concerned with supporting other systems or activities. Software for infrastructures is likely to be distributed and concerned in particular with supporting communication of data, people and/or materials. Hence issues of openness, timeliness, security, lack of corruption and resilience are often important.

<sup>3</sup>The term ‘manifest’ is used in order to distinguish between these kinds of domains and those of computing and data communication: compilers, operating systems, database systems, the Internet, etc.

**Perdurants:** By *perdurants* we mean those quantities of domains for which only a fragment exists, in *space*, if we look at or touch them at any given snapshot in *time* [Merriam Webster].

**Domain Description:** By a *domain description* we shall here mean a syntactic entity, both narrative and formal, describing the domain. That is, a domain description is a structured text, such as shown in Sects. 2–18 (pages 7–116).

**Domain Model:** By a *domain model* we shall here mean the mathematical meaning, the semantics as denoted the domain description.

### 1.2.2 Purpose of Domain Models

The *Triptych* dogma (above) expresses a relation of domain models to software. But domain models serve a wider role. Mathematical models of, say, physics, are primarily constructed to record our understanding of some aspects of the world – only secondarily to serve as a basis for engineering work. So it is with manifest models of infra structure components such banking, insurance, health care, transport, etc. In this, and a series of papers, [15, 14], we shall therefore present the result of infra structure studies. We have, over the years, developed many domain models: [3].

### 1.2.3 Domain Science & Engineering

A series of publications [4, 6, 7, 9, 13] reflects scientific insight into and an engineering methodology for analyzing and describing manifest domains.

## 1.3 A Dichotomy

### 1.3.1 An Outline

As citizens we navigate, daily, in a *God-given* and a *Man-made world*. The God-given world can be characterized, i.e., “domain described”, as having natural science properties. The laws that these natural science properties obey are the same – all over the universe ! The Man-made world can be characterized, i.e., “domain described”, as having infrastructure components<sup>4</sup>. The “laws” that these properties obey are not necessarily quite the same around our planet !

### 1.3.2 The Dichotomy

For our society to work, we are being educated (in primary, secondary, tertiary schools, colleges and at universities). We are taught to to read, write and [verbally] express ourselves, recon and do mathematics, languages, history and the sciences: physics (mechanics, electricity, chemistry, biology, botany’s, zoology, geology, geography, ...), but we are not taught about most of the infrastructure structures<sup>5</sup>. That is the dichotomy.

## 1.4 The Dichotomy Resolved

So there it is:

- first *study* a or several domains;
- then *analyze*, *describe* and *publish* infrastructure domains;
- subsequently *prepare educational texts* “over” these;
- finally introduce ‘*an infrastructures*’ school course.

## 1.5 A [Planned] Series of Infrastructure Domain Models

So this *domain science & engineering* paper – on banking – is one such infrastructure domain description. In all we are and would like to work on these infrastructure domains:

---

<sup>4</sup>state, regional and local government: executive, legislative and judicial, banking, insurance, health care (hospitals, clinics, rehabilitation, family physicians, pharmacies, ...), passenger and goods transport (road, rail, sea and air), manufacturing and sales, publishing (newspapers, radio, TV, books, journals, ...), shops (stores, ...),

<sup>5</sup>See footnote 4.

- **Transport**<sup>6</sup> [16]
- **Health Care**<sup>9</sup> [14]
- **Banking**<sup>7</sup> [10]
- **Insurance**<sup>8</sup> [15]
- etc.

A report on *double-entry bookkeeping* [8] relates strongly to most of these infra-structure component domains<sup>10</sup>.

## **Part I**

# **A SIMPLE BEGINNING**

# Chapter 2

## Kinds of Transports

### Contents

2.1	Informal Outline . . . . .	7
2.2	Narrative & Formalization . . . . .	7

### 2.1 Informal Outline

The transport we have in mind consists of a common transport net, in the following modelled as a graph of uniquely labeled, bi-directed edges and likewise labeled nodes. The transport net is [“intentional pull”] complemented, cf. Sect. 6 on page 25, by a set of conveyors.

Edges, nodes and conveyors are “of kind”: **“road”**, **“rail”**, **“sea”**, and **“air”**; these are literal values<sup>11</sup>. A conveyor is of one kind. Conveyors of kind **“road”** include taxis, buses, trucks and the like. Conveyors of kind **“rail”** include passenger trains, freight trains, etc. Conveyors of kind **“sea”** include sail boats, river and canal barges, fishing vessels, line and ramp freighters, passenger liners, etc. Conveyors of kind **“air”** include helicopters, freight and passenger planes. An edge is of one kind. Edges of kind **“road”** are called automobile roads. Edges of kind **“rail”**, **“sea”** and **“air”** are called rail tracks, sea lanes and air lanes. A node may be of one or more kinds. Nodes of kind **“road”** are called street point (street crossings, street ends, bus stops). Nodes of kind **“rail”** are called train stations. Nodes of kind **“sea”** are called harbours. Nodes of kind **“air”** are called airports.

### 2.2 Narrative & Formalization

1. There are four kinds of transportation: **“road, rail, sea”** and **“air”**.

#### type

1. Kind = **“road”|“rail”|“sea”|“air”**

People are not conveyors, so they are no “of a kind” ! People may be merchandises.

• • •

That is: transport, in this report, is all about moving goods – here referred to as merchandises – around. By what/whichever means: on roads, rails, sea and/or by air – possibly combining two or more of these: moving from (road) trucks to (air) freight and/or by (sea) freighter– whether line or tramps<sup>12</sup>, or in some other order ! We omit considering people as conveyors.

We divide the first formal presentation into five [further] segments: *Overall Transport Endurants*, *Graph Endurants*, *Conveyor Endurants*, *Intentional Pull* and *Perdurants*.

By an overall traffic domain we mean that of a graph<sup>13</sup> and a conveyor<sup>14</sup> sub-domain.

A relation between graphs and conveyors is expressed in the intentional pull section.

<sup>11</sup>– as are **true** and **false**

<sup>12</sup>a boat or ship engaged in the tramp trade is one which does not have a fixed schedule, itinerary nor published ports of call, and trades on the so-called spot market [[https://en.wikipedia.org/wiki/Tramp\\_trade](https://en.wikipedia.org/wiki/Tramp_trade)].

<sup>13</sup>[https://en.wikipedia.org/wiki/Graph\\_\(discrete\\_mathematics\)](https://en.wikipedia.org/wiki/Graph_(discrete_mathematics))

<sup>14</sup>Conveyor: anything that conveys, transports or delivers. [Words are a conveyor of meaning] [<https://en.wiktionary.org/wiki/conveyor>]

The “co-operation” of graphs and conveyors is expressed in the perdurant section.

By a graph we mean a set of nodes and edges: nodes are then interpreted as road intersections (hubs); train stations; river, canal and sea harbours; and airports. A node may be one or more of these. Edges are accordingly interpreted as either street (or road) links, irail tracks, sailing or air routes. An edges can be only one of these. Hence there may be many edges between any two [neighbouring] nodes.

By conveyors we mean *buses, trains, boats, ships, and aircraft*.

The presentation follows the domain analysis & description ontology of Fig. 2.1.

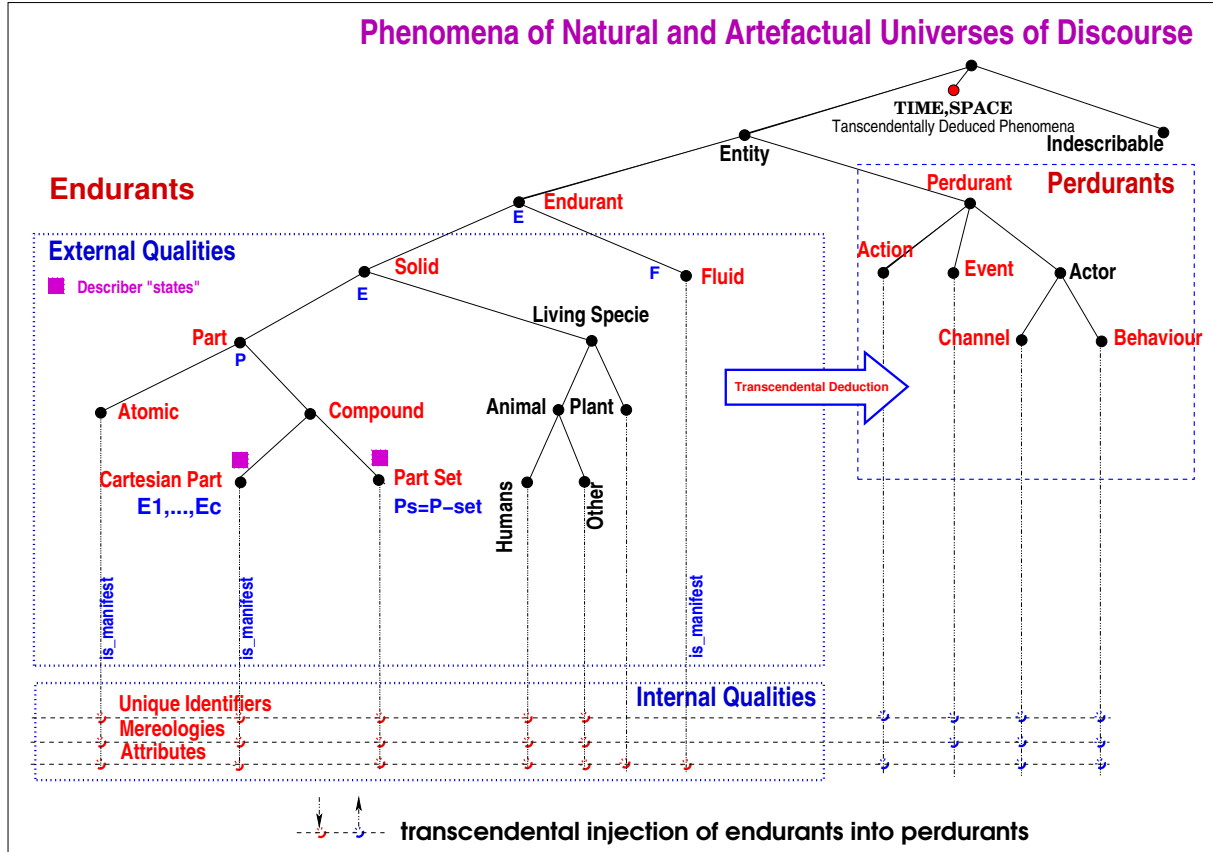

Figure 2.1: Domain Analysis Ontology

## Chapter 3

# Overall “Single-Mode” Transport Endurants

This early section introduces the, perhaps two most central classes of endurants: `transport nets`, in the abstracted form of `graphs`, and `conveyor aggregates`. Conveyor aggregates embody conveyors. Conveyors “move along” nets, and nets serve to [*intentional pull*<sup>15</sup>] “carry” conveyor traffic.

### 3.1 Endurant Sorts & Observers

2. There is the domain of transport.
3. From transport endurants we can observe transport nets, i.e., graphs.
4. And from transport endurants we can observe a conveyor aggregate – embodying conveyors.

#### type

2. `T`
3. `G`
4. `CA`

#### value

3. `obs_G`:  $T \rightarrow G$
4. `obs_CA`:  $T \rightarrow CA$

#### 3.1.1 An Endurant State Notion

We can speak of a transport state.

5. There is given a “global”<sup>16</sup> transport value,  $t$ . It contributes to a transport state.
6. From this transport value one can derive another transport state element: a global graph value,  $g$ .
7. And from this transport value one can derive another transport state element: a global conveyor aggregate value,  $ga$ .
8. We can postulate a transport state to consist of the three endurants:  $t, g, ca$ .

#### value

5.  $t : T$
6.  $g : G = \text{obs\_G}(t)$
7.  $ca : CA = \text{obs\_CA}(t)$
5.  $\sigma_t = \{t\} \cup \{g\} \cup \{ca\}$

---

<sup>15</sup>cf. Sect. 6 on page 25

<sup>16</sup>We shall be using this term: ‘global’ extensively. By double quoting it we intend to express that “global” values are values that can be referred to anywhere in the domain description. We emphasize their “globality” by use this kind of [mathematical] *font* !

## 3.2 Unique Identification

### 3.2.1 Unique Identifier Sorts & Observers

9. The transport enduring has a unique identifier.
10. So has the graph, and
11. the conveyor components.

#### type

9. TI
10. GI
11. CAI

#### value

9.  $\mathbf{uid\_T}: T \rightarrow TI$
10.  $\mathbf{uid\_G}: T \rightarrow GI$
11.  $\mathbf{uid\_CA}: T \rightarrow CAI$

### 3.2.2 A Unique Identifier State Notion

We can postulate a “global” transport state value,  $t$ .

12. From  $t$  we observe its unique identity.
13. Given  $t$  we can derive a “global” graph value  $g$ , hence its unique identity.
14. And a “global” conveyor aggregate value  $ca$ , hence its unique identity..
15. We can therefore postulate an “uppermost” enduring transport state to consist of the three endurents:  $ti, gi, cai$ .

#### value

12.  $ti:TI = \mathbf{uid\_T}(t)$
13.  $gi:GI = \mathbf{uid\_G}(g)$
14.  $cai:CAI = \mathbf{uid\_CA}(ca)$
15.  $\sigma_{tis} = \{ti\} \cup \{gi\} \cup \{cai\}$

### 3.2.3 Uniqueness

16. The three [“uppermost”] transport endurents are distinct: have distinct unique identifiers.

**axiom** [Uniqueness of Transport Identifiers]

16.  $\mathbf{card} \sigma_t = \mathbf{card} \sigma_{tis} = 3$

• • •

It seems that at least the overall transport enduring need not be a manifest one. Hence we leave out treatment of mereology and attributes of the transport enduring.

## Chapter 4

# Graphs: Transport Nets

In addition to describing the external and internal qualities of transport nets we introduce the concepts or *paths*, i.e., *routes*, through/across a transport net.

### 4.1 The Endurant Sorts and Observers

External qualities are the endurant sorts of graphs, node and edges aggregates and nodes and edges, their observers and endurant states.

17. From graphs one can observe an aggregate, i.e., a set,  $ea:EA$ , of edges –
18. From graphs one can observe an aggregate, i.e., a set,  $na:NA$ , of nodes –
19. From an aggregate of edges one can observe a set of edges.
20. From an aggregate of nodes one can observe a set of nodes.
21. Edges are considered atomic.
22. Nodes are considered atomic.
23. We can “lump” all endurants into a sort *parts*.

#### type

17. EA
18. NA
19. ES = E-set
20. NS = N-set
21. E
22. N

$$23. \quad P = G|EA|NA|ES|NA|N|E$$

#### value

17. **obs\_EA**:  $G \rightarrow ES$
18. **obs\_NA**:  $G \rightarrow NS$
19. **obs\_ES**:  $EA \rightarrow ES$
20. **obs\_NS**:  $NA \rightarrow NS$

A transport domain taxonomy is hinted at in Fig. 4.1 on the following page.

Figure 4.1: A Simplified Transport Domain Taxonomy: Transport Nets, **G**, and Conveyors, **C**

#### 4.1.1 An Endurant State

24. Given the global graph value, there is therefore a “global” value of an edge aggregate.
25. Given the global graph value, there is therefore a “global” value of a node aggregate.
26. Given the global edge aggregate value, there is therefore a “global” node value of the set of all edges.
27. Given the global graph value, there is therefore a “global” value of the set of all nodes.
28. The state of all graph endurants is therefore the set of all graph parts.

##### value

24.  $ea = \mathbf{obs\_EA}(g)$
25.  $na = \mathbf{obs\_NA}(g)$
26.  $es = \mathbf{obs\_ES}(g)$
27.  $ns = \mathbf{obs\_NS}(g)$
28.  $\sigma_{ps}:\mathbf{P-set} = \{g\} \cup \{ea\} \cup \{na\} \cup es \cup ns$

• • •

Internal qualities are fourfold: unique identification, mereology, attributes and intentional pull.

## 4.2 Unique Identifiers

Unique Identification has three facets: sort, observers and an axiom.

### 4.2.1 Unique Identifier Sorts and Observers

29. All parts have identification:
30. the graph,
31. the edge and node aggregates,
32. the sets of edges and nodes, and
33. each edge and node.
34. No two of these are the same, i.e., part identifiers are unique.

#### type

29.  $PI = GI|EAI|NAI|ESI|NSI|EI|NI$
29.  $GI, EAI, NAI, ESI, NSI, EI, NI$

#### value

30.  $uid\_G: G \rightarrow GI$
31.  $uid\_EA: EA \rightarrow EAI$ ,  $uid\_NA: NA \rightarrow NAI$
32.  $uid\_ES: ES \rightarrow ESI$ ,  $uid\_NS: NS \rightarrow NSI$
33.  $uid\_E: E \rightarrow EI$ ,  $uid\_N: N \rightarrow NI$

### 4.2.2 A Unique Identifier State

35. There is a “global” unique graph identifier.
36. There are, correspondingly, “global” edge and node aggregate identifiers.
37. There are, correspondingly, “global” edge set and node set identifiers; and
38. set of edge identifiers and
39. set of node identifiers.
40. The unique identifier state is the union of all the unique identifiers.

#### value

35.  $gi = uid\_G(g)$
36.  $ea_{uis} = uid\_EA(ea)$ ,  $na_{uis} = uid\_NA(na)$
37.  $es_{uis} = uid\_ES(ea)$ ,  $ns_{uis} = uid\_NS(na)$
38.  $e_{uis} = \{uid\_E(e) | e: E \bullet e \in es\}$
39.  $n_{uis} = \{uid\_N(n) | n: N \bullet n \in ns\}$
40.  $\sigma_{uis}: PI\text{-}set = \{uid\_P(p) | p: P \bullet p \in \sigma\}$
40.  $\sigma_{uis} = \{gi\} \cup \{ea_{uis}\} \cup \{na_{uis}\} \cup \{es_{uis}\} \cup \{ns_{uis}\} \cup e_{uis} \cup n_{uis}$

### 4.2.3 Uniqueness

41. No two of these are the same, i.e., part identifiers are unique.

#### axiom [Uniqueness of Part Identification]

41.  $card\sigma = card\sigma_{uis}$

### 4.3 Mereology

Mereology has three facets: types, observers and wellformedness.

#### 4.3.1 Mereology Types and Wellformedness, I

- 42. The mereology of a node is a non-empty set of edge identifiers.
- 43. The mereology of an edge is a set of two node identifiers.

##### type

- 42.  $NM = EI\text{-set}$  **axiom**  $\forall nm:NM \cdot \text{card } nm > 0$
- 43.  $EM = NI\text{-set}$  **axiom**  $\forall em:EM \cdot \text{card } em = 2$

#### 4.3.2 Mereology Observers

##### value

- 42. **mereo\_N**:  $N \rightarrow NM$
- 43. **mereo\_E**:  $E \rightarrow EM$

#### 4.3.3 Mereology Wellformedness, II

- 44. The unique identifiers of a node must be those of the edges of the graph.
- 45. The unique identifiers of an edge must be those of the nodes of the graph.

##### **axiom** [Graph Mereology Wellformedness]

- 44.  $\forall n:N \cdot \text{mereo\_N}(n) \subseteq es_{uis}$
- 45.  $\forall e:E \cdot \text{mereo\_E}(e) \subseteq ns_{uis}$

## 4.4 Paths of a Graph

46. A path (of a graph) is a finite<sup>17</sup> sequence of one or more alternating node and edge identifiers such that
- (a) neighbouring edge identifiers are those of the mereology of the “in-between” node, and such that neighbouring node identifiers are/is those of the mereology of the “in-between” edge;
  - (b) and node identifiers of a path are node identifiers of the graph,
  - (c) and its neighbouring edge identifier(s) are in the mereology of the identified node;
  - (d) and edge identifiers of a path are edge identifiers of the graph,
  - (e) and its neighbouring node identifier(s) are/is in the mereology of the identified edge;
  - (f) the kinds of the adjacent nodes and edges “fit”.
47. Given a node [an edge] identifier we can retrieve the identified node [edge].

### type

46. Path = (EI|NI)\*

**axiom** [Wellformed Paths]

46.  $\forall \text{ path:Path} \cdot$

46a.  $\forall \{i, i+1\} \subseteq \text{inds path} \Rightarrow$

46a.  $(\text{is\_NI}(\text{path}[i]) \wedge \text{is\_EI}(\text{path}[i+1]))$

46a.  $\vee \text{is\_EI}(\text{path}[i]) \wedge \text{is\_NI}(\text{path}[i+1]))$

46b.  $\wedge (\text{path}[i] \in ns_{uis} \Rightarrow \text{path}[i+1] \in es_{uis})$

46c.  $\wedge \text{uid\_N}(\text{retr\_node}(\text{path}[i])) \in \text{mereo\_E}(\text{retr\_node}(\text{path}[i+1]))$

46d.  $\wedge (\text{path}[i] \in es_{uis} \Rightarrow \text{path}[i+1] \in ns_{uis})$

46e.  $\wedge \text{uid\_E}(\text{retr\_edge}(\text{path}[i])) \in \text{mereo\_N}(\text{retr\_edge}(\text{path}[i+1]))$

46f.  $\wedge \text{kind}(\text{retr\_unit}(\text{path}[i])) \cap \text{kind}(\text{retr\_unit}(\text{path}[i+1])) \neq \{\}$

### value

47. retr\_node: NI  $\rightarrow$  N, retr\_edge: EI  $\rightarrow$  E, retr\_unit: UI  $\rightarrow$  U

47. retr\_node(ni) as n • n  $\in ns \wedge \text{uid\_}(n)=ni$

47. retr\_edge(ei) as e • e  $\in es \wedge \text{uid\_}(e)=ei$

47. retr\_unit(i) as u • u  $\in ns \cup es \wedge \text{uid\_U}(u)=i$

47. uid\_U(u)  $\equiv \text{is\_E}(u) \rightarrow \text{uid\_U}(u), \text{is\_N}(u) \rightarrow \text{uid\_N}(u)$

The above **pre/post** condition allows for circular paths, i.e., possibly infinite paths that may contain the same node or edge identifier more than once.

We can define a function that given a graph calculates all its non-circular paths.

<sup>17</sup>We shall only consider finite paths. The paths function, Item 48 below, can easily be modified to yield also infinite length paths !

48. The  $\text{paths}^{18}$  function takes a graph and yields a possibly infinite set of paths – satisfying the above well-formedness criterion.

We define the  $\text{paths}$  function in two ways.

49. Either axiomatically
50. in terms of an **as** predicate, with the result being the “largest” such set all of whose paths satisfy the well-formedness criterion;
51. or inductively<sup>19</sup>:
- (a) **basis clause**: every singleton path of either node or edge identifiers of the graph form a path.
  - (b) **inductive clause**: If  $p_i$  and  $p_j$  are finite, respectively possibly infinite paths of the “result”,  $ps$ , such that
    - (c) paths  $p_i \hat{\sim} \langle ui \rangle$  and  $\langle uj \rangle \hat{\sim} p_j$  are in  $ps$ , and
    - (d) the resulting concatenated path is not circular, and
    - (e) the mereology of the last element of  $p_i$  identifies the first element of  $p_j$ ,
    - (f) then their concatenation is a path in  $ps$ .
  - (g) **extremal clause**: No path is an element of the desired set of paths unless it is obtained from the basis and the inductive clause by a finite number of uses.

**value**

```

48. paths: G → Path-infset
49. paths(g) as ps
50.   such that: ∀ p:ps satisfy the above wellformedness
51. paths(g) ≡
51a.   let ps = {⟨ni⟩ | ni:NI ∈ nsuis} ∪ {⟨ei⟩ | ei:EI ∈ esuis}
51f.   ∪ { pî⟨ui⟩̂⟨uj⟩̂pj | pî⟨ui⟩:Path-set, ⟨uj⟩̂pj:Path-infset •
51b.   ∧ ({pî⟨ui⟩, ⟨uj⟩̂pj} ⊆ ps
51c.   ∧ (ui~ ∈ elems pj ∧ uj~ ∈ elems pi)
51e.   ∧ (ui ∈ mereo_U(retr_unit(uj))
51e.   ∧ (uj ∈ mereo_U(retr_unit(ui)))) } in
51g.   ps end
type
48. U = E|N

```

Solution to the equation, lines 51a–51c, is “obtained” by a smallest set fix-point reasoning.

52. Given a “global” graph,  $g$ , we can calculate a “similarly global”  $\text{paths}$  value:

**value**

```

52. paths:Path-set = paths(g)

```

With the notion of paths of a graph one can now examine whether

- a graph is strongly connected, that is, whether any node or edge can be “reached” from any other node or edge; or
- a graph consists of two or more sub-graphs, i.e., there are no edges between nodes in two such sub-graphs;
- etc.

In the next section, i.e., Sect. 4.5.1, we shall now endow nodes and edges to reflect whether they are road intersections, railway stations, harbours, and road links, railway lines, or canal/river/sea- or air-routes, etc.

<sup>18</sup> **Alarm !** Check that this function indeed generates only finite length paths !

<sup>19</sup> [https://www.cs.odu.edu/~toida/nerzic/content/recursive\\_def/more\\_ex\\_rec\\_def.html](https://www.cs.odu.edu/~toida/nerzic/content/recursive_def/more_ex_rec_def.html)

53. We can formulate a *theorem*: for every graph we have that every path,  $p$ , in  $g$ , also contains its reverse path,  $\text{rev}(p)$  in  $g$ .

**theorem:** [All finite paths have finite reverse paths]

53.  $\forall g:G, p:\text{Path} \cdot p \in \text{paths}(g) \Rightarrow \text{rev\_path}(p) \in \text{paths}(g)$

**value**

53.  $\text{rev\_path}: P \rightarrow P$

53.  $\text{rev\_path}(p) \equiv$

53.     **case**  $p$  **of**

53.          $\langle \rangle \rightarrow \langle \rangle,$

53.          $\langle ui \rangle \rightarrow \langle ui \rangle,$

53.          $\langle ui \rangle \hat{p} \langle uj \rangle \rightarrow \langle uj \rangle \hat{\text{rev\_path}(p')} \langle ui \rangle$

53.     **end**

We can define auxiliary functions, for example:

54. Given a kind we can select all the graph paths of that kind.

**value**

54.  $\text{path\_kind}: \text{Path} \rightarrow \text{Kind} \rightarrow \text{Path-set}$

54.  $\text{path\_kind}(p)(k) \text{ as } pks$

54.      $\bullet pks \subseteq \text{paths} \wedge$

54.      $\forall pk:\text{Path} \cdot pk \in pks \wedge \forall \text{elems } pk \cdot \text{kind}(\text{retr\_unit}(pk)) \cap \{k\} \neq \{\}$

## 4.5 Attributes

With endurants now being endowed with, i.e., having attributes, graphs come to “look”, more-and-more, as transport nets !

Attributes has three facets: types, observers and wellformedness.

### 4.5.1 Attribute Types & Observers

We introduce but just a few Graph Attributes.

55. From a node we can thus observe the “kind” of node: whether “**road crossing**”, train “**station**”, canal/river/sea boat/ship “**harbour**”, and/or “**airport**” – one or more ! [A static attribute]

**Edge:**

56. From an edge we can thus observe the “kind” of edge: whether it represents a street (segment between two neighbouring road crossings), or a rail track (between two neighbouring stations), or a sea route between two neighbouring (canal/river/sea) harbours or an aircraft route between two neighbouring airports.
57. From an edge we can we can observe its length<sup>20</sup>. [Static Attribute]
58. and the cost<sup>21</sup> of using the edge<sup>22</sup>. [Static Attribute]

**type**

55. `NodeKind = Kind-set` **axiom**  $\forall nk:NodeKind \cdot nk \neq \{\}$
56. `EdgeKind = Kind-set` **axiom**  $\forall ek:EdgeKind \cdot \mathbf{card} \, ek = 1$
57. `LEN = Nat`
58. `COST = Nat`

**value**

55. `attr_NodeKind: N  $\rightarrow$  NodeKind`
56. `attr_Edgekind: E  $\rightarrow$  EdgeKind`
57. `attr_LEN: E  $\rightarrow$  LEN`
58. `attr_COST: E  $\rightarrow$  COST`

<sup>20</sup>LEN is here “formalized” in terms of **Natural** numbers. Whether such lengths stand for mm, cm, m, km, inches, feet, yard, mile or other we presently leave unspecified.

<sup>21</sup>COST is here “formalized” in terms of **Natural** numbers. Whether such costs stand for \$, €, £, or other we presently leave unspecified.

<sup>22</sup>See [5]. The usual arithmetic operators apply: scaling between ... Check also [20].

59. Given a node or an edge we can observe its kinds.
60. Given a graph, and a “kind”, we can calculate all its paths of the same kind.
61. Given a finite route we can calculate its lengths
62. and costs.
63. We can also calculate the shortest route, possibly a set, of a graph,
64. and the least costly,<sup>23</sup>
65. etc.

**value**

```

59. kind: (E|N) → EdgeKind|NodeKind
59. kind{en} ≡ is_E(en)→attr.Edgekind(en), is_N→attr.Edgekind(en)

60. route_kind: G → Kind → Path-set
60. route_kind(g)(k) ≡
60.   { ⟨p[i]|i:Nat, p:P·p∈paths(p)∧1≤i≤len(p)∧k∈kind(p[i])⟩ }

61. path_length: P → LEN
61. path_length(p) ≡
61.   case p of
61.     ⟨⟩ → 0
61.     ⟨ui⟩ → retr_path_length(ui),
61.     ⟨ui⟩^p' → retr_length(ui)+path_path_length(p')
61.   end
61. retr_path_length: UI → LEN
61. retr_path_length(ui) ≡ (is_EI(ui)→attr.LEN(retr_edge(ui)), is_NI(ui)→0)

62. path_cost: P → LEN
62. path_cost(p) ≡
62.   case p of
62.     ⟨⟩ → 0
62.     ⟨ui⟩ → retr_cost(ui),
62.     ⟨ui⟩^p' → retr_path_cost(ui)+path_cost(p')
62.   end

62. retr_path_cost: UI → COST
62. retr_path_cost(ui) ≡ (is_EI(ui)→attr.COST(retr_edge(ui)), is_NI(ui)→0)

63. shortest_route: G → P-set
63. shortest_route(g) ≡
63.   let ps = paths(g) in
63.   { p | p:P · retr_len(p) ∧ ∀ p':P·p'∈ps ∧ retr_path_len(p)≤retr_path_len(p') }
63.   end

65. etc.

```

The “etc.” covers such auxiliary functions as shortest route of a given kind , least costly route of a given kind , etc. !

More Graph Attributes will be added [“later”].

<sup>23</sup>See William Cook’s Web page: [https://www.math.uwaterloo.ca/tsp/index.html?mc\\_cid=a51d99f2aa&mc\\_eid=783b63461a](https://www.math.uwaterloo.ca/tsp/index.html?mc_cid=a51d99f2aa&mc_eid=783b63461a) and *Quanta Magazine*’s Fundamentals Computer Science Web page <https://mail.google.com/mail/u/0/?ui=2#inbox/FMfcgz-QZTzdWzqtRWmVWkQrcNzzDrSnJ>

### 4.5.2 Attribute Wellformedness

- 66. If a node is of some kind, then there must be at least one edge leading to/from it of the same kind.
- 67. If an edge is of some kind, then the nodes connected to it must also be of that [same] kind.
- 68. If a node is of kind other than "car", then there must be an edge "of" that node of kind "car". [One must be able to drive to stations, harbours and airports by car, taxi, lorry (truck) or bus !]

#### **axiom**

66.

66.

67.

67.

68.

68.

## Chapter 5

# Conveyors, I

We remind the reader that conveyors are either for the **road**: cars, taxis, trucks, buses, etc.; or for the **rail**: trains, or for the **sea**: sailboats, barges, freighters, passenger liners, etc.; or for the **air**: helicopters and airplanes.

### 5.1 Conveyor Endurant Sorts & Observers

69. From a conveyor aggregate one can observe a finite set of conveyors.

70. A conveyor is either a

- a road conveyor
  - car,
  - taxi,
  - bus,
  - truck, etc.,
- or a rail conveyor
  - passenger train,
  - freight train, etc.,
- or a water conveyor
  - sailboat,
  - barge,
  - fishing vessel,
- or an airborne conveyor
  - freighter,
  - passenger liner, etc.,
  - civil aircraft,
  - freight plane, or
  - passenger aircraft, etc.

71. Conveyors are atomic parts.

72. Conveyors or “of kind”.

73. Conveyor aggregates are uniquely identified.

74. Conveyors are uniquely identified.

#### type

69. **CS** = **C-set**

70. **C** = **Road**|**Rail**|**Water**|**Air**

70. **Road** = ...

70. **Rail** = ...

70. **Sea** = ...

70. **Air** = ...

73. **CAI**

74. **CI**

#### value

73. **uid\_CA**: **CA** → **CAI**

74. **uid\_C**: **C** → **CI**

## 5.2 Unique Identifiers

### 5.2.1 Unique Identifier State

75. The unique identifier of a conveyor aggregate contributes to the unique identifier state for the [entire] transport domain.
76. The unique identifiers of all conveyors contribute to the unique identifier state for the [entire] transport domain.
77. The overall unique identifier state,  $\sigma_{uis}$ , is therefore the union of all the unique identifiers of all parts of a transport domain.

#### value

75.  $cai:CAI = uid\_CA(ca)$
76.  $cis:CI\text{-}set = \{ uid\_C(c) \mid c:C \cdot c \in obs\_CS(ca) \}$
77.  $\sigma_{uis} = \sigma_p \cup \{cai\} \cup cis$

### 5.2.2 Uniqueness

78. All parts are uniquely identified.

**axiom** [All parts are uniquely identified]

78.  $card \sigma = card \sigma_{uis}$

### 5.2.3 Conveyor Retrieval

79. From a conveyor identifier one can obtain, via  $cs$ , the conveyor of that identification.

#### value

79.  $retr\_conveyor: CI \rightarrow C$
79.  $retr\_conveyor(ci) \equiv \iota c:C \cdot c \in cs \wedge uid\_C(c)=ci$

## 5.3 Mereology

### 5.3.1 Mereology Types & Observers

80. The mereology of a conveyor is a finite set of edge and node identifiers that it may “visit”.<sup>24</sup>

#### type

80.  $CM = UI\text{-}set$

#### value

80.  $mereo\_C: C \rightarrow CM$

---

<sup>24</sup>We shall extend this mereology in Sect. 13.1 on page 59.

### 5.3.2 Mereology Wellformedness

81. The identifiers of a conveyor mereology must be those of the edges and nodes of the transport graph,  $g$ .
82. The kind of conveyor must “fit” the kind of edges and nodes<sup>25</sup>.

**axiom** [Conveyor Mereology of Right Kind]

```

81.  $\forall c:C \cdot c \in cs \Rightarrow \forall ui:UI \cdot ui \in mereo\_C(c)$ 
81.  $\Rightarrow ui \in e_{uis} \cup n_{uis}$ 
82.  $\wedge c\_kind(c) \cap kind(retr\_unit(ui)) \neq \{\}$  182

```

## 5.4 Attributes

### 5.4.1 Conveyor Attribute Types & Observers

In this section we deal with some attributes. Further conveyor attributes are brought forward in Sect. 12.3.3 page 56.

83. Conveyors are of kind. [Static Attribute]
84. These routes must be of the kind of the conveyors traveling them !
85. Conveyors either stand still or move. That is, they have position in the graph, an index on the service route. Either the position is at a node, or somewhere, a fraction,  $f$ , of a distance along an edge, from one node to an adjacent. [Programmable Attribute]
86. The service route index must be commensurate with the conveyor position.
87. We omit further possible attributes: Speed, Acceleration, Weight, ....

**type**

```

83. Kind
85. CPos = AtNode | OnEdge
85. AtNode :: NI
85. OnEdge :: NI  $\times$  (F  $\times$  EI)  $\times$  NI
85. F = Real axiom  $\forall f:F \cdot 0 < f < 1$ 

```

**value**

```

83. attr_Kind: C  $\rightarrow$  Kind
85. attr_CPos: C  $\rightarrow$  CPos
87. ...

```

**axiom** [Routes of commensurate kind]

```

84.  $\forall c:C \cdot \text{let } ps = \text{attr\_Routes}(c) \text{ in } \forall p:\text{Path} \cdot p \in ps \wedge ps \subseteq \text{path\_kind}(p)(\text{kind}(c))$  end

```

---

<sup>25</sup>Cars, Taxis, Buses, Trucks move along edges and nodes of kind **road** [a literal value, like **true** and **false** are literal values], Passenger and Freight Trains move along edges and nodes of kind **rail** [a literal value], Sail Boats, Barges, Fishing Vessels, Ferries, Freighters, Ferries and Passenger Liners move along edges and nodes of kind **sea** [a literal value] and Private Aircraft, Helicopters, Freight Planes and Passenger Aircraft move along edges and nodes of kind **air** [a literal value].

### 5.4.2 Routes

88. The following properties hold of any route:

- (a) the current route of a conveyor must always be in the routes of that conveyor.
- (b) The static attribute `Routes` must all start and end with a node identifier.
- (c) When initialized, a conveyor “starts” with a `CurrentRoute` chosen from the `Routes`.
- (d) At any moment a conveyor moves along a [programmable attribute] *current* route.
- (e) When moving from an edge to a node the current route is shortened by one.
- (f) When a route is thereby exhausted, i.e.,  $\langle \rangle$ , the conveyor may decide to select a new route.
- (g) It does so from the static attribute `Routes`.
  - i. The previous, exhausted route ended with a node identifier.
  - ii. The next, to be current, route must start with that node identifier.

**axiom** [Commensurable Routes]

88.  $\forall c:C, r:Routes, cr:CurrRoute \bullet r = attr\_Routes(c) \wedge cr = attr\_CurrRoute(c)$

88a.  $cr \in r$

88b.  $\wedge is\_NI(hd\ r) \wedge is\_NI(r[len\ r])$

For *cars* the `Routes` attribute may exclude certain paths, for example such toll-roads for which they have no license. When, for example, *buses*, *trains*, *ferries* and *passenger aircraft*, the routes are such that for every pat there is at least one path that “connects” to the former: ends, respectively starts with identical node identifiers. Usually the set of routes contains just two paths: one from node  $n_i$  to node  $n_j$  and the other from node  $n_j$  to node  $n_i$ . And so forth !

### 5.4.3 Conveyor Attribute Wellformedness

TO BE WRITTEN

# Chapter 6

## Intentional Pull, I

### 6.1 History Attributes

History attributes record when conveyors (cars, trains, boats and aircraft) were where and at which times. They are chronologically ordered, time-stamped sequences of event notices. History attributes are programmable.

History attributes “record” events. Conveyors, as controlled by, say humans, may not note down these **events**, and edges and nodes, which we in some sense consider innate<sup>26</sup>, “most likely” do not notice them.

But we, “us”, humans, can speak about and recall [these, and “other”<sup>27</sup>] events – and they are therefore an essential aspect of modelling any manifest domain.

89. We “lump” nodes and edges into single element ways [i.e., endurants].

90. The ordered,  $\text{TIME}^{28}$ -stamped, history attribute event notices record the vehicles, by their unique identifiers.

91. The ordered,  $\text{TIME}$ -stamped, conveyor history attribute event notices record the ways, by their unique identifiers.

#### type

89.  $W = N|E$

89.  $WI = NI|EI$

90.  $WHist = (s\_t:\text{TIME} \times VI)^*$

91.  $ConvHist = (s\_t:\text{TIME} \times CI)^*$

#### value

89.  $\text{retr}_W: WI \rightarrow N|E$

89.  $\text{retr}_W(wi) \equiv ! \quad w:W \cdot w \in ns \cup es \wedge \text{uid}_W(w)=wi$

90.  $\text{attr}_WHist: W \rightarrow WHist$

90.  $\text{attr}_ConvHist: C \rightarrow ConvHist \quad \text{!}90$

#### axiom [Ordered Way and Conveyor Histories]

90.  $\forall wh:WHist \cdot \{i,i+1\} \subseteq \text{inds } wh \Rightarrow s\_t(rh[i]) < s\_t(wh[i+1])$

91.  $\forall ch:ConvHist \cdot \{i,i+1\} \subseteq \text{inds } ch \Rightarrow s\_t(ch[i]) < s\_t(ch[i+1])$

<sup>26</sup>An innate quality or ability is one that you were born with, not one you have learned. That is: we consider edges and nodes to be innate wrt. observing and recording the where-about events of conveyors – other than indirectly through the space they “occupy”, the possible wear & tear of the road surface or rail track, or possible pollution of the sea and air, etc.

<sup>27</sup>By the seemingly cryptic “other” events, we may, in the context of transport, think of such events as *conveyor breakdown*, *edge collapse*, etc.

<sup>28</sup> $\text{TIME}$  is a “global” phenomenon.

We say *15:23 June 12, 2025 CET*, and mean that it is now *23 minutes past 3pm, 25th of February 2025, Central European Time*.

$\text{TI}$  stands for time-interval.

We say *3 hours and 23 minutes*.

## 6.2 An Intentional Pull

Nodes and edges are intended to “carry” traffic [only] in the form of vehicles, and vehicles are intended to move along [only] ways, i.e., nodes and edges.

- 92. for all conveyors (of a transport) if
  - (a) a conveyor is said to be on a way, i.e, at a node [resp. on an edge], at time  $\tau$ ,
  - (b) then that way must “carry” that conveyor
  - (c) at exactly that same time;
- 93. and vice-versa, if-and-only-if, for all ways
  - (a) a way is said to “carry” a conveyor at time  $\tau$ ,
  - (b) then that conveyor must be on that way
  - (c) at exactly that same time.

### Intentional Pull:

```

92.   $\forall c:C \cdot c \in cs \cdot$ 
92a.    let  $ch:CH = attr\_CH(c)$  in
92a.     $\exists ! i:Nat \cdot i \in inds\ ch \cdot$ 
92a.    let  $(\tau, wi) = ch[i]$  in
92b.    let  $wh:WH = attr\_WH(retr\_way(wi))$  in
92c.     $\exists ! j:Nat \cdot j \in inds\ WH \cdot s\_t(wh[j]) = \tau$ 
92.    end end end
93.   $\equiv$ 
93.   $\forall w:W \cdot w \in es \cup ns \cdot$ 
93a.    let  $wh = attr\_WH(w)$  in
93a.     $\exists ! k:Nat \cdot k \in inds\ wh \cdot$ 
93a.    let  $(\tau, ci) = wh[k]$  in
93b.    let  $ch:CH = attr\_WH(retr\_conveyor(ci))$  in
93c.     $\exists \ell:Nat \cdot \ell \in inds\ ch \cdot s\_t(ch[\ell]) = \tau$ 
93.    end end end

```

# Chapter 7

## Single-mode Transport Behaviours

The previous sections, Sects. 3–6, studied, analyzed & described a transport domain syntactically, that is: its manifest forms and properties, but not its meaning, i.e., semantics. This sections is about that: the “meaning”, so-to-speak, of endurants. This will be done by **transcendentally deducing** *behaviours* and *actions* from the description of endurants. Endurants are **transcendentally deduced** into behaviours, and described as *s* with arguments. Their internal properties are **transcendentally deduced** into arguments of these behaviours. We choose to only endow edges, nodes and conveyors with behaviours. Behaviours synchronize and communicate via “the ether” – here RSL/CSP-modeled as a **channel** array that allows conveyor, node and edge behaviours ( $u_i, u_j, u_k$ ) to cooperate !

### 7.1 Communication

#### 7.1.1 Communication Medium

94. There is a “global” communication, i.e., behaviour interaction medium, **comm**. It allows transport Behaviours to synchronize and exchange information of type *M*.

**channel**

94. **comm**[  $\{i, j\} \mid i, j : UI \bullet \{i, j\} \in uis$  ] MSG

#### 7.1.2 Communication Causes

95. A conveyor,  $ci : CI$ , at a node decides to remain at that node.
96. A conveyor,  $ci : CI$ , at a node decides to change route.
97. A conveyor,  $ci : CI$ , at a node decides to leave the node, and
98. to enter an edge.
99. A conveyor,  $ci : CI$ , on an edge decides to move on.
100. A conveyor,  $ci : CI$ , on an edge decides to leave that edge, and
101. to enter the node.
102. And a conveyor,  $ci : CI$ , at a node or on an edge may decide, “surreptitiously” or otherwise, to just **stop**.

#### 7.1.3 Communication Messages

103. The message is simple: a time stamp and the identity of a node, an edge or a conveyor.

**type**

103.  $MSG = TIME \times (NI|EI|CI)$

## 7.2 Behaviours

So we model conveyor, node and edge behaviours. Each of these behaviour functions has arguments of the following kind:

- a **unique identifier**, never changes, distinguishes between multiple instances of edges, or nodes, or conveyors;
- a *mereology*; and
- **attributes**:
  - **static attributes**, i.e., attributes whose value never changes;
  - **monitorable attributes**, i.e., attributes whose value changes “at their own volition”: itself nor cooperating behaviours cannot influence their value – we shall not consider monitorable attributes in this study; and
  - **programmable values**, i.e., attributes whose value may be changed by the behaviour – i.e., acts like variables that can be read and updated !

Each of these behaviours are modelled as processes that may “go-on-and-on-forever” – modelled in terms of *tail-recursion* – modelled also in the specifying **Unit** as part, “the last”, of the behaviour signature.

## 7.3 Behaviour Signatures

104. We present the conveyor, edge and node behaviour signatures.

**value**

```

104. conveyor: CI→CM→(Kind×Routes)→(CurrRoute×CPos×CH)→Unit
104. edge: EI→EM→(Kind×LEN×...)→NH→Unit
104. node: NI→NM→(Kind-set×...)→NH→Unit

```

## 7.4 Behaviour Definitions

### 7.4.1 Conveyor Behaviours

- A conveyor alternates between being at a node or on edge, so its behaviour is defined in terms of “either” and their “progress” onto “the other” !

#### • CONVEYOR Behaviour AT A NODE:

105. A conveyor at a node either

- (a) changes its current route, and choose another, the next current route, or
- (b) remains at that node, idling, or circling around, or
- (c) is entering an edge, or
- (d) **stops** at that node, i.e., leaves the transport altogether.

**value**

```

105. conveyor(ci)(cm)(k,routes)(cr,AtNode(ni),ch) ≡
105a. conveyor_change_route(ci)(cm)(k,routes)(cr,AtNode(ni),ch)
105b. || conveyor_remains_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)
105c. || conveyor_enters_edge(ci)(cm)(k,routes)(cr,AtNode(ni),ch)
105d. || conveyor_stops_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)

```

• CONVEYOR **Actions** AT A NODE:

106. A conveyor may non-deterministically decide to **change** its current route at a node

- (a) at time  $\tau$ ,
- (b) selects of next, to be, current route from routes such that that the chosen route begins with the node being otherwise left,
- (c) so informing the node, and
- (d) updates its history,
- (e) whereupon it resumes being a conveyor with both updated current route and history.

```

106. conveyor_change_route(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
106a.   let  $\tau = \text{record\_TIME}()$ ,
106b.   ncr = select_next_route(ni,routes),
106d.   ch' =  $\langle(\tau,ni)\rangle^{\text{ch}}$  in
106c.   comm[{ci,ni}] ! ( $\tau,ci$ ) ;
106e.   conveyor_at_node(ci)(cm)(k,routes)(ncr,AtNode(ni),ch') end

106b. selects_next_route:NI  $\times$  Routes  $\rightarrow$  CurrRoute
106b. selects_next_route(ni,routes) as ncr  $\cdot$  ncr  $\in$  routes  $\wedge$  hd ncr = ni

```

107. A conveyor **remains** at a node

- (a) at some time,  $\tau$ ,
- (b) which is to be noted by the node behaviour ni
- (c) whereupon the conveyor resumes being a conveyor except now with an updated conveyor history, ch.

**value**

```

107. conveyor_remains_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
107a.   let  $\tau = \text{record\_TIME}()$  in
107b.   comm[{ci,ni}] ! ( $\tau,ci$ );
107c.   conveyor(ci)(cm)(k,routes)(cr,AtNode(ni), $\langle(\tau,ni)\rangle^{\text{ch}}$ ) end

```

108. A conveyor at a node may non-deterministically choose to leave a node and **enter** an edge

- (a) at some time,  $\tau$ , and as determined by the current route's next element, enters that route, i.e., edge,
- (b) which is to be noted by the node and designated edge behaviours ni,
- (c) updates its position
- (d) and its history accordingly,, and
- (e) resumes being a conveyor on an edge.

**value**

```

108. conveyor_enters_edge(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
108a.   let  $\tau = \text{record\_TIME}()$  in
108b.   ( comm[{ci,ni}] ! ( $\tau,ni$ ) || comm[{ci,ni}] ! ( $\tau,\text{hd cr}$ ) ) ;
108c.   let ei = hd cr in let {ni,ni'} = mereo.E(retr_edge(ei)(es)) in
108c.   let cpos = onEdge(hd cr,(ei,(ni,f,ni),ni')) in
108e.   conveyor(ci)(cm)(k,routes)(cr,cpos, $\langle(\tau,ni)\rangle^{\text{ch}}$ ) end end end end

```

109. And a conveyor may non-deterministically choose to abandon being a conveyor, i.e., leaving transport altogether – **stopping** !
110. But first it notifies the node at which it stops.

**value**

```

109. conveyor_stops_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch) ≡
110.   let  $\tau = \text{record\_TIME}()$  in
110.   comm[{ci,ni}] ! ( $\tau$ ,ci) ;
109.   stop end

```

- A conveyor behaviour on an edge alternates.

• **CONVEYOR Behaviour ON EDGE**

111. An edge [behaviour] at an edge external non-deterministically either:

- (a) **moves** along the edge, a fraction “at a time”,
- (b) **stops** on the edge and thereby “leaves” transport; or
- (c) **enters** a node.

```

111. conveyor(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e), nuit), ch) ≡
111a.   conveyor_moves_on_edge(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e), nuit), ch)
111c.   || conveyor_stops_on_edge(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e), nuit), ch)
111b.   || conveyor_enters_node(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e), nuit), ch)

```

• **CONVEYOR Actions ON AN EDGE:**

112. A conveyor **moving** along an edge

- (a) at time  $\tau$  is modelled by
- (b) incrementing the fraction of its position
- (c) (while updating its history)
- (d) notifying the edge [behaviour]
- (e) [technically speaking] adjusting its position, and, finally,
- (f) resuming being a thus updated conveyor [OnEdge]

**value**

```

112. conveyor_moves_on_edge(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e), nuit), ch) ≡
112a.   let  $\tau = \text{record\_TIME}()$ ,
112b.    $\varepsilon : \text{Real} \cdot 0 < \varepsilon \ll 1$  in
112b.   let  $f' = f + \varepsilon$ ,
112d.   cpos = OnEdge(nuif, (f',e), nuit) in
112c.   let  $ch' = \langle (\tau, ci) \rangle^{\text{ch}}$  in
112e.   comm[{ci,ej}] ! ( $\tau$ ,ci) ;
112f.   conveyor(ci)(cm)(k,routes)(cr,cpos,ch') end end end
112. pre hd cr = nuif

```

113. A conveyor **enters** a node

- (a) at time  $\tau$  is modelled by altering its position
- (b) notifying both the edge and designated node behaviours
- (c) resumes being an updated conveyor behaviour.

**value**

```

113. conveyor_enters_node(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,ei),nui),ch) ≡
113a.   let  $\tau = \text{record\_TIME}()$ , cpos = AtNode(hd cr) in
113b.   ( comm[{ci,ei}] ! ( $\tau$ ,ci) || comm[{ci,nui}] ! ( $\tau$ ,ci) ) ;
113c.   conveyor(ci)(cm)(k,routes)(tl cr,cpos,⟨( $\tau$ ,ci)⟩ch) end
113.   pre hd cr = nuif

```

114. A conveyor may non-deterministically choose to abandon being a conveyor, i.e., leaving transport altogether – **stopping** !

115. But first it notifies the edge at which it stops.

**value**

```

114. conveyor_stops_on_edge(ci)(cm)(k,routes)(cr,OnEdge(nuif, (f,e),nui),ch) ≡
115.   let  $\tau = \text{record\_TIME}()$  in
115.   comm[{ci,ej}] ! ( $\tau$ ,ci) ;
114.   stop end
114.   pre hd cr = nuif

```

### 7.4.2 Node Behaviour

116. **Node** [behaviours]

- (a) external non-deterministically accept conveyor, ci, actions
- (b) at times  $\tau$
- (c) augment their histories accordingly and
- (d) resumes being node behaviours.

**value**

```

116. node: NI → NM → (NodeKind×...) → NH Unit
116a. node(ni)(nm)(nk,...)(nh) ≡
116c.   let msg = [] { comm[{ni,ci}] ? | ci:CI • ci ∈ nm } in
116d.   node(ni)(nm)(...)(⟨msg⟩nh) end

```

### 7.4.3 Edge Behaviour

117. **Edge** [behaviours] – similarly,

- (a) external non-deterministically, accept conveyor, ci, actions
- (b) augment their histories accordingly and
- (c) resumes being edge behaviours.

**value**

```

117. edge: EI → EM → (EdgeKind×LEN×COST×...) → EH Unit
117a. edge(ei)(em)(len,cost,...)(eh) ≡
117b.   let msg = [] { comm[{ei,ci}] ? | ci:CI • ci ∈ em } in
117c.   edge(ni)(em)(len,cost,...)(⟨msg⟩eh) end

```

## 7.5 Domain Instantiation

By domain initialization we mean the *invocation*<sup>29</sup> of all behaviours.

118. The overall initialization expresses the parallel composition of the initialization of

119. all conveyors,

120. all nodes and

121. all edges.

```

118. initialization: Unit → Unit
118. initialization() ≡ t
119.   || { conveyor
119.       (uid_C(c))
119.       (mereo_C(c))
119.       (attr_KindC(c), attr_RoutesC(c)) [Static Attrs.]
119.   [Programmable Attrs.] (attr_CurrRouteC(c), attr_CPoC(c)s, attr_CHC(c))
119.       | c:C•c ∈ cs}
120.   || || { edge
120.       (uid_E(e))
120.       (mereo_E(e))
120.       (attr_EdgeKind(e), ...) [Static Attrs.]
120.   [Programmable Attrs.] (attr_(e), attr_EH(e))
120.       | e:E•e ∈ es }
121.   || || { node
121.       (uid_N(n))
121.       (mereo_N(n))
121.       (attr_NodeKinds(n)) [Static Attrs.]
121.   [Programmable Attrs.] (attr_NH(n))
121.       | n:N•n ∈ ns}

```

But: the initialization of conveyors is too simplified: To capture an essence of transport it seems reasonable to distinguish between the various kinds of conveyors.

Thus the initialization of conveyors “really” amounts to the initialization of all

- |                               |                               |                       |
|-------------------------------|-------------------------------|-----------------------|
| • cars, trucks, taxis,        | • sailboats, barges, vessels, | • freight planes and  |
| • buses,                      | • passenger liners, ferries,  |                       |
| • passenger & freight trains, | • civil aircraft,             | • passenger aircraft. |

---

<sup>29</sup>Invocation – in the colloquial – “call”

## **Part II**

# **A MULTI-MODE TRANSPORT: ENDURANTS**

## Chapter 8

# Multi-mode Transport

The domain description of Chapters 4–7 was for single-mode transport: It focused on transport nets and conveyors. For a model of *multi-mode transport* we suggest to introduce:

- **Merchandise:** By merchandise we shall here understand a wider concept than usually thought of. To us *merchandise* is what customers wishes to and actually send and receive: *goods*, if You will, that have weight, volume and value. Could be a car, a book, 10.000 barrels of oil, etc. Merchandise is treated in Sect. 10.
- **Customers:** A [multi-mode transport] *customer* is either, if persons, wishes to travel from one place to another, or if otherwise wishes to send merchandise from one place, e.g., the customer's place, e.g. a node or an edge, to be received by a *recipient* at that another place. In the latter case customers are persons, businesses, organizations, or other, i.e., are *senders* or *receiver*, i.e., *recipients*. Customers are treated in Sect. 11.
- **Conveyor Companies:** A *conveyor company* is a business which manages a fleet of conveyors: trucks, freight trains freighters (i.e., vessels) and freight aircraft. Conveyor Companies are treated in Sect. 12.
- **Logistics Companies:** A transport logistics company handles requests from *senders* of *passengers* or *goods* (containers, oil, coal, gas, grain, salt, cars, machinery, etc.) to have these conveyed from one node to another, world-wide, by whatever means of combinations of conveyors and routes. A logistics company thus is a company which arranges for transport of merchandise. To do so logistics firms have access to the transport offerings of a number of, not necessarily all, conveyor companies: their routes, timetable and costs. Logistics Companies are treated in Sect. 14.
- **“Overall Top” Transport Endurants:** The *graph*, *conveyors*, *merchandise*, *customers*, *conveyor companies* and *logistics companies* form the transport domain. As a whole they are defined in Sect. 9.

After these sections we

- outline an **intentional pull** for multi-mode domains, Sect. 15,
- summarize the syntax of multi-mode transport **commands**, Sect. 16,
- and cover multi-mode transport **behaviours**, Sect. 18.

• • •

To obtain the services of merchandise transport comes at a **price**, the *cost*.

The notion of *cost* is related to the notion of **cash**. It costs to have merchandise transported. Customers shall pay costs. Say, in the form of cash<sup>30</sup>. Costs shall be modelled as integers. They are attributes of merchandise, customers, conveyor companies and logistics companies.

You may very well think of cash as manifest, i.e., as *endurant* parts. But in the context of transport we can abstract from that. If we were to model cash as *endurants*, then were we to model it as *atomic* or *composite*? Now we avoid such questions!

---

<sup>30</sup> – or through withdrawal from bank accounts, or other. See [10].

## Chapter 9

# “Top” Transport Endurants

### 9.1 The Endurants – External Qualities

#### 9.1.1 A Transport Taxonomy

We refer to Fig. 9.1 for a taxonomy of the transport domain.

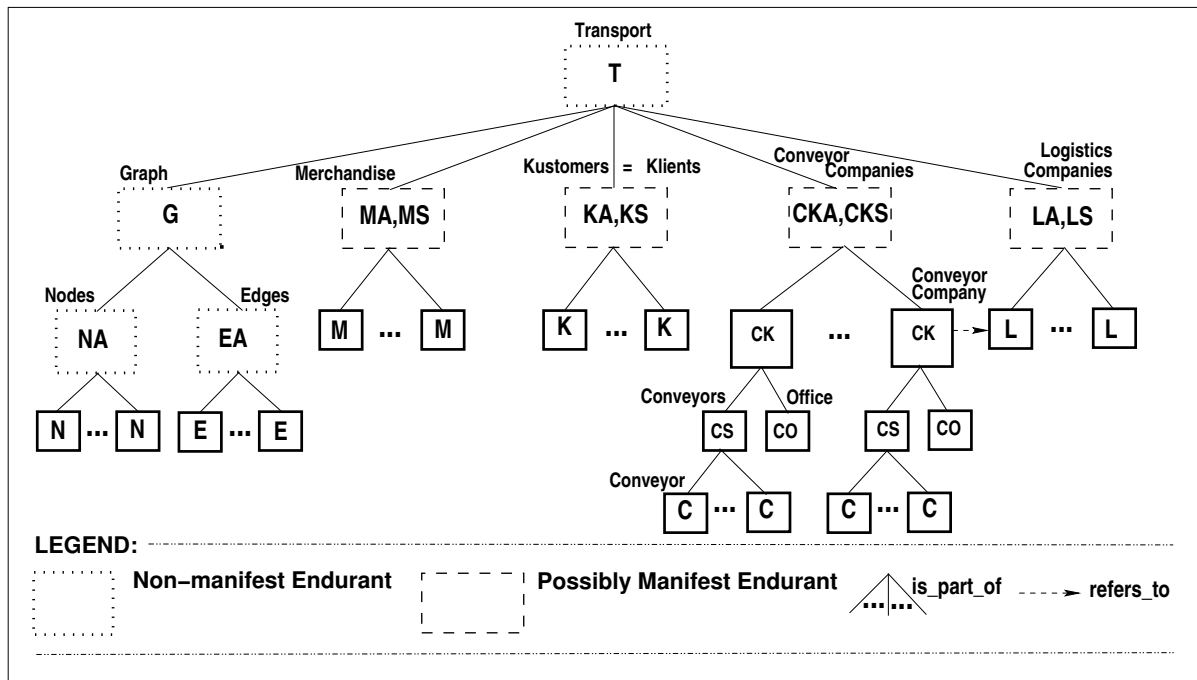

Figure 9.1: A Transport Domain Taxonomy

The “downwards” slanted lines express that the “lower” part is part of the “upper” part.

The “horizontal arrow” expresses that the source part embeds to “arrow” part. [Only one is illustrated; more could !]

### 9.1.2 An Overview of The Endurants

#### The Transport Domain

122. There is given the domain of interest, i.e., the universe of discourse,  $T$ .

#### type

122.  $T$

#### value

122.  $t:T$

#### Graphs

**Graphs** were treated in Sect. 4.

123. In a transport domain can observe the *transport net*, i.e., a *graph*,  $g:G$ .

124. From a graph we can observe a node aggregate,

125. and an edge aggregate.

126. From a node aggregate we can observe a set of nodes.

127. From an edge aggregate we can observe a set of edges.

#### type

123.  $G$

124.  $NA$

125.  $EA$

126.  $NS = \mathbf{N-set}$

127.  $ES = \mathbf{E-set}$

126.  $N$

127.  $E$

#### value

123.  $\mathbf{obs\_G}: T \rightarrow G$

124.  $\mathbf{obs\_NA}: G \rightarrow NA$

125.  $\mathbf{obs\_EA}: G \rightarrow EA$

126.  $\mathbf{obs\_NS}: NA \rightarrow NA$

127.  $\mathbf{obs\_ES}: EA \rightarrow ES$

And likewise for the unique identification of the manifest of these endurants.

#### type

123.  $GI$

124.  $NAI$

125.  $EAI$

126.  $NO$

127.  $EI$

#### value

123.  $\mathbf{uid\_G}: G \rightarrow GI$

124.  $\mathbf{uid\_NA}: G \rightarrow NAI$

125.  $\mathbf{uid\_EA}: G \rightarrow EAI$

126.  $\mathbf{uid\_N}: N \rightarrow NI$

127.  $\mathbf{uid\_E}: E \rightarrow EI$

**Merchandise**

**Merchandise** is treated in Sect. 10.

128. From a transport domain we can observe a *merchandise aggregate*,  $ma:MA$ ;

129. and from a *merchandise aggregate* we can observe the set,  $ms:MS$  of merchandise.

And likewise for the unique identification of the manifest of these endurants.

type	value
128. $MA$	128. $\mathbf{obs\_MA}: G \rightarrow MA$
129. $MS = M\text{-set}$	129. $\mathbf{obs\_MS}: MA \rightarrow MS$

type	value
128. $MAI$	128. $\mathbf{uid\_MA}: MA \rightarrow MAI$
129. $MI$	129. $\mathbf{uid\_M}: M \rightarrow MI$

**Customers**

**Customers** are treated in Sect. 11.

130. From a transport domain we can observe a “*k*”*ustomers aggregate*,  $ka:KA$ ;

131. and from a *customer aggregate* we can observe the set,  $ks:KS$  of customers.

132. We can speak of the set,  $ks$ , of all customers of a transport domain.

And likewise for the unique identification of the manifest of these endurants.

type	type
130. $KA$	130. $KAI$
131. $KS = K\text{-set}$	131. $KI$
value	value
130. $\mathbf{obs\_KA}: T \rightarrow KA$	130. $\mathbf{uid\_KA}: KA \rightarrow KAI$
131. $\mathbf{obs\_KS}: KA \rightarrow KS$	131. $\mathbf{uid\_K}: K \rightarrow KI$
	132. $ks:K\text{-set} = \mathbf{obs\_KS}(\mathbf{obs\_KA}(t))$

**Conveyor Companies & Conveyors**

**Conveyors** were treated in Sect. 5 and **Conveyor Companies** are treated in Sect. 12.

133. In a *transport domain*,  $t:T$ , we can observe the composite endurant of *conveyor companies aggregate*,  $cca:CCA$ .
134. From a *conveyor companies aggregate*,  $cca:CCA$ , we can observe a set,  $cks:CKS$ , of *conveyor companies*.
135. *Conveyor companies* are considered atomic.

From a *conveyor company*,  $ck:CK$ , we can observe

136. a *conveyor aggregate*,  $ca:CA$ ,
137. and, from that, a *conveyor set*,  $cs:CS$ , which is a set of *conveyors*.

From a *conveyor company*,  $ck:CK$ , we can also observe

138. we can observe an atomic *conveyor company office*,  $co:CO$ ,
139. and an atomic, optional *logistics subsidiary*,  $ol:oL$ , i.e., the conveyor company may operate its own *logistics company*.

type	value
133. CKA	133. <b>obs_CKA</b> : $T \rightarrow CKA$
134. $CKS = CK\text{-}set$	134. <b>obs_CKS</b> : $CKA \rightarrow CKS$
135. CK	136. <b>obs_CA</b> : $CK \rightarrow CA$
136. CA	137. <b>obs_CS</b> : $CA \rightarrow CS$
137. $CS = C\text{-}set$	138. <b>obs_CO</b> : $CK \rightarrow CO$
138. CO	139. <b>obs_oL</b> : $CK \rightarrow oL$
139. $oL = LI \mid nil$	

And likewise for the unique identification of the manifest of these endurants.

type	value
133. CKAI	133. <b>uid_CKA</b> : $CKA \rightarrow CKAI$
135. CKI	135. <b>uid_CK</b> : $CK \rightarrow CKI$
136. CAI	136. <b>uid_CA</b> : $CK \rightarrow CAI$
138. COI	138. <b>uid_CO</b> : $CK \rightarrow COI$
139. $oLI = LI \mid nil$	139. <b>uid_oL</b> : $CK \rightarrow oLI$

• • •

We shall, in the following, not treat the concepts of *conveyor [company] offices* and *the logistics company* parts of *conveyor companies*. We shall also not treat the concepts of *conveyor aggregates* and *conveyor sets*, but will treat the concept of *conveyors*.

**Logistics Companies**

**Logistics Companies** are treated in Sect. 14.

140. From a transport domain we can observe a *logistics companies aggregate*;

141. and from a *logistics companies aggregate* we can observe the set,  $ls:LS$  of *logistics companies*.

And likewise for the unique identification of the manifest of these endurants.

<b>type</b>	
140.	LA
141.	LS = L-set
<b>value</b>	
140.	<b>obs</b> <sub>LA</sub> : $T \rightarrow LA$
141.	<b>obs</b> <sub>LS</sub> : $LA \rightarrow LS$

<b>type</b>	
140.	LAI
141.	LI
<b>value</b>	
140.	<b>uid</b> <sub>LA</sub> : $LA \rightarrow LAI$
141.	<b>uid</b> <sub>L</sub> : $LA \rightarrow LS$

**Node and Edges** were first treated in Sect. 4. To this we now add a widened understanding of their mereologies and attributes.

142. The mereology of nodes is a pair of the set identifiers of edges imminent upon the nodes and the set of identifiers of the customers and conveyors that can deposit merchandises “on hold” at the nodes.

143. The mereology of nodes is a pair of the set identifiers of [the pair of] nodes “at ether end of the edge” and the set of identifiers of conveyors that may travel along the edge.

Nodes and edges have the following attributes:

- (a) Nodes have merchandises “on hold” – by contract number,
- (b) and nodes have node histories: time-stamped events of which conveyors notified their presence at the node.
- (c) Edges have length,
- (d) cost of travel,
- (e) and event histories:: time-stamped events of which conveyors notified their presence at the edge.

<b>type</b>	
142.	$NM = EI\text{-set} \times (KI VI)\text{-set}$
143.	$EM = HI\text{-set} \times VI\text{-set}$
143a.	$OnHold = ContractNu \xrightarrow{m} M\text{-set}$
143b.	$NHist = (TIME \times CI)^*$
143c.	LEN
143d.	COST
143e.	$EHist = (TIME \times CI)^*$
<b>value</b>	
142.	<b>mereo</b> <sub>N</sub> : $N \rightarrow NM$
143.	<b>mereo</b> <sub>E</sub> : $E \rightarrow EM$
143a.	<b>attr</b> <sub>OnHold</sub> : $N \rightarrow OnHold$
143b.	<b>attr</b> <sub>NHist</sub> : $N \rightarrow NHist$
143c.	<b>attr</b> <sub>LEN</sub> : $E \rightarrow LEN$
143d.	<b>attr</b> <sub>COST</sub> : $E \rightarrow COST$
143e.	<b>attr</b> <sub>EHist</sub> : $E \rightarrow EHist$

• • •

**Atomic Parts:**

144. Nodes, edges, merchandise, “k”ustomers, conveyors, conveyor company offices, and logistics firms are considered atomic.

**type**

144. N, E, M, K, C, CO, L

We shall not [really] consider conveyor offices and logistics firms in this report.

## 9.2 On Internal Qualities.

We discuss which endurants may be considered manifest. That is, to which of the parts – as, for example, shown by the boxes of Fig. 9.1 on page 37 – one might associate internal qualities, say in preparation for their part behaviours.

- With the *transport* part,  $t:T$ , we might – here rather loosely – associate a *ministry of transport*, or ...; We shall omit such associations.
- With the *graph* part,  $g:G$ , we might associate various other public (or private) institutions: *ministry of roads*, *ministry of railways*, *ministry of shipping*, and “*ministry of air*” ! We shall omit such associations.
- With the *merchandise* part one might associate some institution of *consumer protection* or other. We shall omit such associations.
- With the *customer (client, consumer)* part one might associate some kind of institutions. We shall omit such associations.
- With the *conveyor company* part one might associate some *conveyor association*. We shall omit such associations.
- With the *logistics companies* part one might similarly associate some associations. We shall omit such associations.
- With nodes, edges, merchandise, customers [clients], conveyor sets and conveyor offices we have and shall associate internal qualities – in respective sections 4, 5 and 10, 11, 12 and 14.

So we shall not elaborate on any internal qualities of the “top-level” endurants, that is those of  $T$ ,  $G$ ,  $NA$ ,  $EA$ ,  $MA$ ,  $KA$ ,  $CCA$ , and  $LA$ . But we shall, later, in indicated sections, elaborate on internal qualities of the “next-level” endurants, i.e., those of  $M$ ,  $K$ ,  $CK$ ,  $CS$ ,  $CO$  and  $L$  [Sects. 10, 11, 12 and 14] – as we already have for  $N$ ,  $E$  and  $C$  [Sects. 4 and 5].

Figure 9.1 on page 37 hints at manifest, possibly manifest and non-manifest parts.

## 9.3 Conveyor Companies versus Logistics Companies.

Is it really necessary to distinguish between the two: conveyor and logistics companies ? Examples of the two are:

- **conveyor companies:** Maersk<sup>31</sup>, DSV<sup>32</sup> SAS, American Airlines, British Air, Deutsche Bahn, SNCF, Amtrack, Arriva, Greyhound, P&O, Dachser<sup>33</sup>, etc.
- **logistics companies:** TUI, Expedia, etc.<sup>34</sup>

As You may have deduced from the examples: some of the conveyor companies also operate “own” logistics departments, i.e., companies. But their functions must be separated: Conveyor companies fundamentally operate conveyors, and, only as a necessity, embody logistics departments – which basically only handle only their “mother”, i.e., the conveyor company’s own conveyors. Logistic companies, in general, make use of several conveyor companies.

## 9.4 Financial Matters

Transport implies expenses. *Cost* and *payment* of conveyance, is implied, but we have chosen to omit modelling these facets. Both conveyor and logistics companies rely on *creating, writing/editing, reading, copying* and *destroying documents*. The implied *double bookkeeping* will also not be modelled. These financial facets are not an essence, so we have decided, of the core aspects of transport. We refer to [10, 11] and [8], respectively, for treatments of these three domains.

<sup>31</sup>Maersk, Danish, is one of the world’s largest container shipping lines.

<sup>32</sup>DSV, Danish, is one of the world’s largest trucking companies.

<sup>33</sup><https://www.dachser.dk/da/>

<sup>34</sup>Yes, it has not gone unnoticed, that these “travel agencies” are, indeed, logistics companies – when seen from inside the daily operations of these. Also: I find it difficult to find conveyor companies that do not have a logistics [sub-office] !

# Chapter 10

## Merchandise

We shall use the term *merchandise* as a common denominator for “all that can be transported” ! living species: people<sup>35</sup>, animals, plants, wheat, etc.; solid materials: iron ore, automobiles, timber, etc.; fluid materials: oil, gas, water, etc. Perhaps a better term would/should have been *goods*

### 10.1 Merchandise Endurants

#### 10.1.1 External Qualities

145. There is the atomic endurant: merchandise.

**type**

145. M

**value**

145. *m*:M

---

<sup>35</sup>Please do not be confused: No, we do not refer to people as slaves !

### 10.1.2 Internal Qualities

We lump the presentation of identification, mereology and attributes of merchandises into one, the present, section.

#### Unique Identifiers:

146. Merchandises have unique identification. [That is: no two items of merchandise have the same identification, and these are distinct from the identification of all other parts of the transport domain.]

#### Mereology:

147. The mereology of any [item or piece of] merchandise is the set of customers and conveyors that may possess or transport that merchandise.

#### Attributes:

148. Merchandises have practical identification: names, manufacture, place of origin, etc. Two or more merchandise may have the same such identification.
149. Merchandises have current position – a programmable attributes
150. Merchandises have size, approximate height, width and depth.
151. Merchandises have weight.
152. Merchandises have cost.
153. Merchandises have flammability.
154. Merchandises may be insured.
155. Merchandises have a history: an chronologically descending, ordered sequence of event notes:
156. Events are either ...
157. Et cetera ...

#### type

##### Unique Identifiers:

146. `MI`

##### Mereology:

147. `MM = KI-set × CI-set`

##### Attributes:

148. `MIId = Name×Mfg×Origin×...`

149. `Position = (NI × (F × EI) × NI) | NI | CI`

150. `Size = Nat×Nat×Nat`

151. `Weight = Real`

152. `Cost = Nat`

153. `Flammability = "flammable"|"inflammable"|"combustible"|...`

154. `Insurance`

155. `MHist = (TIME×Event)*`

156. `Event = ... | ... | ... | ...`

157. `...`

#### value

146. `uid_M: M → MI`

147. `mereo_M: M → MM`

148. `attr_MIId: M → MIId`

149. `attr_Position: M → Position`

150. `attr_Size: M → Size`

151. `attr_Weight: M → Weight`

152. `attr_Cost: M → Cost`

153. `attr_Flammability: M → Flammability`

154. `attr_Insurance: M → Insurance`

155. `attr_MHist: M → MHist`

Merchandises must satisfy some axiom[s]:

158. No one merchandise must be at exactly one position at any one time.

**axiom**

158. ...

## 10.2 Representation of Merchandises

Merchandises are inert: does not move by their own volition ! But merchandises are being moved – by conveyors. So how do we present merchandise ? In Sect. 5.4 on page 23, when we first described conveyor attributes, we did not endow them with merchandise. That will be remedied in Sect. 12.3.5 Page 53.

We shall then, in Sect. 12.3.5 Page 53, see that we choose to model merchandises on a conveyor as a set of merchandise unique identifiers !

159. Here we shall model the existence of a set of merchandises as a state value.

**value**

159.  $ms : \mathbf{M}\text{-set} = \mathbf{obs\_MS}(\mathbf{obs\_MA}(t))$

Given the unique identifier,  $mi$ , of a merchandise and given the “global” merchandises state we can “retrieve” the identified merchandise:

160. The retrieve merchandise function, `retr_merchandise`, takes a merchandise identifier and in the context of the “global” merchandises state  $ms$ ,

161. yields the unique  $(t) \mathbf{m}$  with that identifier in  $ms$  that has that identifier.

**value**

160.  $\mathbf{retr\_merchandise} : \mathbf{MI} \times \mathbf{MS} \rightarrow \mathbf{M}$

161.  $\mathbf{retr\_merchandise}(mi)(ms) \equiv \iota \mathbf{m} : \mathbf{M} \cdot \mathbf{m} \in ms \wedge \mathbf{uid\_M}(\mathbf{m}) = mi$

## 10.3 Humans

162. Humans can be merchandise.<sup>36</sup>

**type**

162. `Human`

**value**

162.  $\mathbf{is\_Human} : \mathbf{M} \rightarrow \mathbf{Bool}$

---

<sup>36</sup>Not in the sense of illegal immigrants, sadly, but in the sense of legally “ticketed” passengers of bus, train, ship and aircraft conveyors.

# Chapter 11

## Customer

We shall use the term '**customer**' for any person or institution that requests transportation of or receives transported merchandise. Other terms could be '**client**' or '**consumer**'. All have the advantage of beginning with a 'c'. Which we [quickly] convert into a 'k' – for same pronunciation !

### 11.1 Customer Endurants

#### 11.1.1 Endurant Sort

163. There is the atomic enduring: customer.

**type**

163.  $K$

#### 11.1.2 A State Notion

164. There is the “global” transport value,  $t:T$ .

165. From it we observe a likewise “global”, the set of all customers,  $ks:KS$ .

**value**

164.  $t:T$

165.  $ks:KS = \mathbf{obs\_KS}(\mathbf{obs\_KA}(t))$

## 11.2 Customer Qualities

We lump the presentation of identification, mereology and attributes of customers into one, the present, section.

### Unique Identifiers:

- 166. Customers have unique identification.
- 167. We can speak of the identities of all customers, as a “globally” known value.

### Mereology:

- 168. The mereology of any customer is the triple of the set of merchandises and the logistics firms that such firms may be requested to arrange transport.

### Attributes:

- 169. Customers have practical identification: name and address.
- 170. Customers posses merchandise.
- 171. Customers have outstanding requests: a time-stamped set of shipping notices: to be or being sent, or to request to or expecting to receive.
- 172. Customers accumulate, for every event, a Customer History: A time-stamped, chronologically ordered sequence of event records: most recent event first.
- 173. Events are either ...
- 174.

### type

#### Unique Identifiers:

166.  $KI$

#### Mereology:

168.  $KM = MI\text{-}set \times (CKI|LI)\text{-}set \times CI\text{-}set$

#### Attributes:

169.  $CustId = CustNam \times CustAdd \times \dots$

170.  $Possess = MI\text{-}set$

171.  $OutReqs = \dots$

172.  $CustHist = (TIME \times Event)^*$

173.  $Event = \dots$

174.  $\dots$

### value

#### Unique Identifiers:

166.  $uid\_K: K \rightarrow KI$

### value

167.  $kis:KI\text{-}set = \{ uid\_K(k) \mid k:K \cdot k \in ks^{37} \}$

#### Mereology:

168.  $mereo\_K: K \rightarrow KM$

#### Attributes:

169.  $attr\_CustId: K \rightarrow CustId$

170.  $attr\_Possess: K \rightarrow Possess$

171.  $attr\_OutReqs: K \rightarrow OutReqs$

172.  $attr\_CustHist: K \rightarrow CustHist$

---

<sup>37</sup> $ks$  was defined in Item 165 on the preceding page.

## 11.3 Customer Retrieval

175. The `retrieve_customer` function, `retr_customer`, takes a customer identifier and in the context of the “global” customers state,  $ks$ ,

176. yields the unique,  $\iota, k$  with that identifier in  $ks$  that has that identifier.

**value**

159. `retr_customer`:  $KI \times KS \rightarrow K$

161. `retr_customer(ki)(ks)  $\equiv \iota k:K \cdot k \in ks \wedge \mathbf{uid}_K(k)=ki$`

## 11.4 Customer Commands

We refer to Sect. 16.6.1 on page 73.

# Chapter 12

## Conveyor Companies

We remind the reader of Sect. 9.3 on page 42.

The purpose of a conveyor company is to provide conveyors for the transport of merchandise. It does so in an interaction between customers and logistics companies.

Conveyor companies has basically two main functions wrt. transport provision: a conveyor office and an entity which manages the day-to-day movement of conveyors. A derivative, “in-house” function may be that of logistics: the more-or-less optimal allocation of conveyor resources, routes, etc.

### 12.1 Conveyor Authorities.

We shall not consider the various public government conveyor authorities that “oversee” specific kinds of conveyor traffic. In many countries there are, for example, several railway operators, but the underlying rail net is usually operated by a [semi-]public government authority.

### 12.2 Conveyor Company Endurants.

#### 12.2.1 Conveyor Company External Qualities

##### 12.2.1.1 Sorts and Observers

From page 40 we repeat:

#### **type**

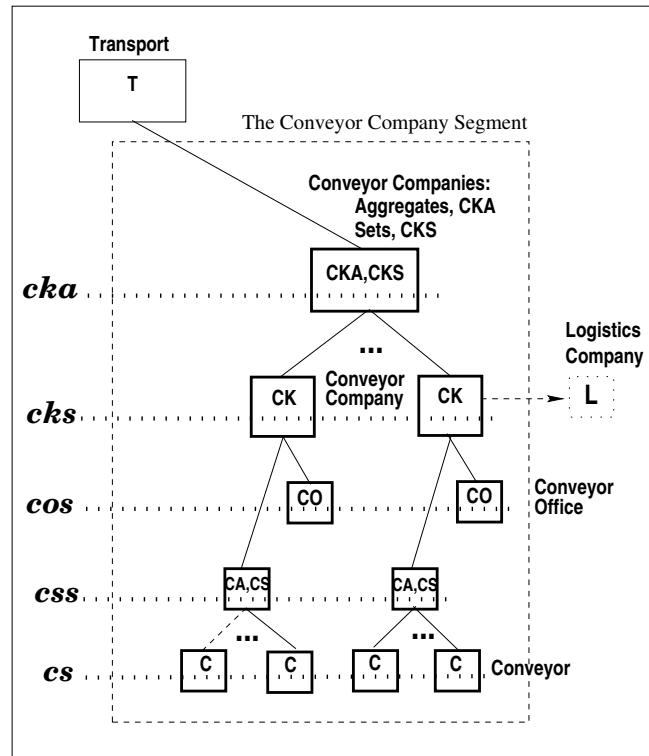

```
133. CKA
134. CKS = CK-set
135. CK
136. CA
137. CS = C-set
138. CO
139. oL = LI | nil
```

#### **value**

```
133. obs_CKA: T → CKA
134. obs_CKS: CKA → CKS
136. obs_CA: CK → CA
137. obs_CS: CA → CS
138. obs_CO: CK → CO
139. obs_oL: CK → oL
```

### 12.2.1.2 A Conveyor Company Taxonomy

In preparation for our presentation of describing “the state” of the conveyor company segment we show a taxonomy for the full structure of conveyor company parts in Fig. 12.1. The rendition is just an edited segment of Fig. 9.1 on page 37.

**Figure 12.1: Conveyor Companies Taxonomy**  
 We consider all parts to be manifest  
 Horizontal dotted lines indicate “state” components

### 12.2.2 A Conveyor Aggregate State Notion

There is the “global” transport domain value,  $t:T$ .

177. From  $t$  we can observe a likewise “global” conveyor company aggregate value,  $cca:CCA$ .

**value**

177.  $cka:CKA = \mathbf{obs\_CKA}(t)$

178. From  $cca$  we can observe a likewise “global” set of conveyor companies value,  $cks:CKS$ .

**value**

178.  $cks:CKS = \mathbf{obs\_CKS}(cca)$

179. From  $cks$  we can observe a likewise “global” set of conveyors value,  $css:CS\text{-set}$ .

**value**

179.  $css:CS\text{-set} = \bigcup \{ \mathbf{obs\_CS}(ck) \mid ck:CK \cdot ck \in css \}$

180. From *ccs* we can observe a likewise “global” of all set of *conveyors* value, *cs*:**C-set**.

**value**

$$180. \quad cs:\mathbf{C}\text{-set} = \cup\{\mathbf{obs\_CS}(cs) \mid cs:\mathbf{CS} \cdot cs \in cks\}$$

181. From *cks* we can observe a likewise “global” set of *conveyor company offices* value, *cos*:**CO-set**.

**value**

$$181. \quad cos:\mathbf{C}\text{-set} = \cup\{\mathbf{obs\_CO}(cs) \mid cs:\mathbf{CS} \cdot cs \in cks\}$$

182. From *cks* we can observe a likewise “global” set of optional *logistics companies* value, *ols*:**oL-set**. They do not contribute to the conveyor company segment state.

**value**

$$182. \quad ols:\mathbf{C}\text{-set} = \cup\{\mathbf{obs\_oL}(ck) \mid ck:\mathbf{CK} \cdot ck \in cks\} \setminus \{\mathbf{nil}\}$$

183. We can postulate an overall conveyor company state,  $\sigma_{CK}$ .

**value**

$$183. \quad \sigma_{CK} = \{cca\} \cup \{cks\} \cup ccs \cup cs \cup cos$$

## 12.3 Conveyor Company Internal Qualities

### 12.3.1 Conveyor Company Identification

There are three issues here.

#### 12.3.1.1 Conveyor Company Uniqueness of Identification.

The following conveyor companies parts have unique identifications:

- 184. the conveyor companies aggregate,
- 185. the conveyor companies set of conveyor companies
- 186. conveyor companies,
- 187. conveyors,
- 188. conveyor offices, and
- 189. optional logistics firms.

**type**

- 184. CCAI
- 185. CKSI
- 186. CAI
- 187. CI
- 188. COI
- 189. oLI

**value**

- 184. **uid\_CCA**: CCA  $\rightarrow$  CCAI
- 185. **uid\_CKS**: CKS  $\rightarrow$  CKSI
- 186. **uid\_CA**: CK  $\rightarrow$  CKI
- 187. **uid\_C**: C  $\rightarrow$  CI
- 188. **uid\_CO**: CO  $\rightarrow$  COI
- 189. **uid\_oL**: oL  $\rightarrow$  oLI

### 12.3.1.2 Conveyor Company Unique Identifier State.

190. We can postulate, cf. Item 183 on the previous page, an overall conveyor company unique identifiers state,  $\sigma_{CK_{uid}}$ .

**value**

190.  $\sigma_{CK_{uid}} =$   
 190.  $\{uid\_CCA(cca)\} [ = cca_{ui} ]$   
 190.  $\cup \{uid\_CKS(cks)\} [ = cks_{uid} ]$   
 190.  $\cup \{uid\_CK(ck) | ck : CK \bullet ck \in cks\} [ = cks_{uid} ]$   
 190.  $\cup \{uid\_C(cs) | c : C \bullet cs \in cs\} [ = cs_{uid} ]$   
 190.  $\cup \{uid\_CO(co) | co : CO \bullet co \in cos\} [ = cos_{uid} ]$

Where we use some non-RSL definitions of separate unique identifier sets – to be used in formulas 195–200 below.

### 12.3.1.3 Conveyor Company Uniqueness of Identification.

191. All conveyor company parts are uniquely identified.

**axiom** [Unique Conveyor Companies Parts]

191.  $card\sigma_{CK} = card\sigma_{CK_{uid}}$

## 12.3.2 Conveyor Company Mereology

In the previous chapter Sect. 12.3.1, on unique identification, (pages 53-54), we treated all parts of the conveyor companies segment, as manifest. In the present chapter we shall only consider

- conveyor company set of conveyors,  $cks$ ,
- conveyor company conveyors,  $cs$ , and
- conveyor company offices,  $cos$ ,

as manifest.

192. The mereology of conveyor company sets of conveyors, are a pair of (i) the identities of the conveyors they “manage” and (ii) conveyor company, i.e., the conveyor company office they are “paired with”.
193. The mereology of a conveyor is the identity conveyor company set of conveyors they “belong to”.
194. The mereology of conveyor company office is a triplet: (i) the conveyor company sets of conveyors identity, (ii) a set of logistics company identities and (iii) a set of customers [who may handle their transport matters without the help of logistics firms].

**type**

192.  $CAM = CI\text{-}set \times COI$   
 193.  $CM = CAI$   
 194.  $COM = CAI \times LI\text{-}set \times KI\text{-}set$

**value**

192.  $mereo\_CA : CA \rightarrow CAM$   
 193.  $mereo\_C : C \rightarrow CAI$   
 194.  $mereo\_CO : CO \rightarrow COM$

195. The Well-formed Conveyor Company Mereologies axiom has several clauses:
196. No two conveyor companies share [conveyor company sets of] conveyors.
197. The conveyor aggregate is correctly identified.
198. Conveyor,  $c:C$ , identities are those of actual conveyors,
199. **and** the identified logistics companies are actual
200. **and** the “k”ustomers are actual.

**axiom** [Well-formed Conveyor Company Mereologies]

```

196. share_conveyors(cks)
195.  $\wedge \forall ck:CK \cdot ck \in cks \Rightarrow$ 
      let (cai,lis,kis) = mereo.CO(ck),
      cs = obs_CS(obs_CA(ck)) in
197.   cai=uid_CA(obs_CA(ck))
198.    $\wedge \{\mathbf{uid}_C(c) | c:C \cdot c \in cs\} \in cs_{uid}$ 
199.    $\wedge lis \subseteq lis$ 
200.    $\wedge kis \subseteq kis$ 
      end

196. share_conveyors: CKS  $\rightarrow$  Bool
196. share_conveyors(cks)  $\equiv$ 
196.    $\forall ck, ck':CK \cdot ck \neq ck' \wedge \{ck, ck'\} \subseteq cks$ 
196.    $\Rightarrow \mathbf{obs\_CS}(\mathbf{obs\_CA}(ck))ck \cap \mathbf{obs\_CS}(\mathbf{obs\_CA}(ck')) \neq \{\}$ 

```

### 12.3.3 Conveyor Company Attributes

Conveyor Companies have a number of attributes. We mention a few:

201. General conveyor company information, which conveyors it manages, their timed routes, capacity, maximum load, etc.<sup>38</sup>
202. Resources: own and other conveyor companies' conveyors, their status, etc.
203. Contract history:
  - (a) for every contract, once “on the move”, which ways: from sending customer to node, from node to conveyor, from conveyor to node and from node to receiving customer<sup>39</sup>.
204. Orders
  - (a) by contract number
  - (b) and an indexed set of offers,
  - (c) each index being a choice number.
205. Current business: set of command messages.<sup>40</sup>
206. Past business: set of command messages.<sup>41</sup>
207. History: **TIME**-stamped, chronologically ordered, descending sequence of **Events**: the messages received from customers and conveyors.
208. From choice and contract numbers one can observe the identity of the issuing conveyor company.

#### type

201. **ConvCompInfo** = ...
202. **Resources** = ...
203. **Contracts** = **ContractNu**  $\xrightarrow{m}$  **Move**\*
- 203a. **Move** =  $(KI \times NI) \mid (NI \times CI) \mid (CI \times NI) \mid (NI \times KI)$
204. **Orders** = **ContractNu**  $\xrightarrow{m}$  **Offers**
- 204a. **ContractNu**
- 204b. **Offers** = **ChoiceNu**  $\xrightarrow{m}$  **TR**
- 204c. **ChoiceNu**
205. **CurrBuss** = **MSG-set**
206. **PastBuss** = **MSG-set**
207. **CKHist** = **MSG**\*

#### value

201. **attr\_ConvCompInfo**:  $C \rightarrow \text{ConvCompInfo}$
203. **attr\_Contracts**:  $CK \rightarrow \text{Contracts}$
204. **attr\_Orders**:  $CK \rightarrow \text{Orders}$
205. **attr\_CurrBuss**:  $CK \rightarrow \text{CurrBuss}$
206. **attr\_PastBuss**:  $CK \rightarrow \text{PastBuss}$
207. **attr\_CKHist**:  $CK \rightarrow \text{CKHist}$

#### value

208. **xtr\_CKI**:  $(\text{ChoiceNu} \mid \text{ContractNu}) \rightarrow \text{CKI}$

<sup>38</sup>**Note:** The conveyor company information attribute contains “all” the information that is needed for the calculation of offers etc.

<sup>39</sup>**Note:** This conveyor company attribute is updated every time a conveyor [k12] and a customer [k15] acknowledges the transfer of merchandises

<sup>40</sup>**Note:** Received messages are “stashed” here for future handling – and removed once handled.

<sup>41</sup>**Note:** Handled [current business] messages here “stashed” here, transferred from the **current business** attributes.

### 12.3.3.1 Progress Updates

Conveyor companies are involved in many actions. Most of the actions [referred to by these commands] entail an update of conveyor companies' Progress attribute. Some directly by the conveyor companies. Others specifically initiated by [the] so-called Acknowledgment actions originating with customers and conveyors.

These explicit acknowledgments are of the form:

- $\mathbf{mk\_Acknowledgment}(\mathbf{TIME}, \mathbf{contract\_number}, (ui, uj))$

where:

- $(ui, uj): (KI \times CKI) \mid (CKI \times KI) \mid (KI \times NI) \mid (NI \times CI) \mid (CI \times NI) \mid (NI \times KI)$

The explicit acknowledgments entail updates to conveyor companies' Progress attribute:

209. The `upd_contracts` function takes a `contracts` attribute and an `acknowledgment` and yields an updated `contracts` attribute.

**value**

209. `upd_contracts: Contracts  $\rightarrow$  Acknowledgment  $\rightarrow$  Contracts`

209. `upd_contracts(con) (mk_Acknowledgment( $\tau$ , cnu, (ui, uj)))  $\equiv$`

209. `con  $\dagger$  [cnu  $\mapsto$  con(cnu)  $\wedge$  (mk_Acknowledgment( $\tau$ , cnu, (ui, uj)))]`

## 12.4 Conveyor Company Commands.

We refer to Sect. 16.8.2 on page 79.

## Chapter 13

# Conveyors, II

We have already dealt with conveyors: their external qualities, Sect. 5.1 on page 21, and two of their internal qualities, *unique identification*, Sect. 5.2 on page 22, and *mereology*, Sect. 5.3 on page 22. We shall, however, extend the mereology first sketched in Sect. 5.3 on page 22.

### 13.1 Conveyor Mereology

210. The mereology of a conveyor is a quadruple:

- the set of all identifiers of nodes and edges that the conveyor may travel;
- the set of all identifiers of conveyor companies that it may receive directives from and to which it shall have to acknowledge transfers of merchandises;
- the set of all identifiers of customers that it shall inform of pending collections and deliveries, and to which it shall deliver merchandises;

**type**

210.  $CM = (NI|EI)_{\text{set}} \times CKI\text{-set} \times KI\text{-set}$

**value**

210.  $\text{mereo\_C}: C \rightarrow CM$

## 13.2 Conveyor Attributes

In Sect. 5.4 on page 23 we already touched upon some conveyor attributes.

We now extend these<sup>42</sup>.

211. Conveyors are of kind [unchanged] [Static Attribute].
212. Conveyors convey, i.e., stores (holds), merchandises by contract number.
213. They follow a *service route*<sup>43</sup>,  $sr:SR$  [programmable attribute] which is a path, of three or more node and edge identifiers – beginning with a node and ending with a node.
214. Conveyors “carry” and index attribute –  $SRIndex$  – – indicating as to where in the service route they, at present, are.
215. Conveyors also operate according to two “tables”: for each node that it visits there are contracts to be unloaded, respectively loaded. This information is given to conveyors, at any time, by conveyor company directives.
216. Conveyors, having unloaded a contract at a final node informs the receiving customer of arrival. Note the difference between that attribute type name *Finals* (with a plural ‘s’) and the function argument identifier type *Final* (with no such plural).
217. Conveyors have, dynamically, a position –  $CPos$  – either they are at a node or are en route, i.e., on an edge between two adjacent nodes.
218. The  $SR$ ,  $SRIndex$  and  $CPos$  must be commensurate: if index  $i:SRIndex$  designates a node  $ni$ , then  $cpos:CPos$  must be a  $AtNode(ni)$ , else, it designates an edge,  $ej$ , and  $cpos:CPos$  must be some  $OnEdge(.,(.,ej),.)$ .<sup>44</sup>
219. And conveyors have a history.
220. We omit further possible attributes: *Speed*, *Acceleration*, *Weight*, ....
221. These routes must be of the kind of the conveyors traveling them !

### type

211.  $Kind$
212.  $Stowage = ContractNu \xrightarrow{m} M\text{-}set$
215.  $TBU, TBL = NI \xrightarrow{m} ContractNu\text{-}set$
213.  $SR = Path$
214.  $SRIndex = Nat$
216.  $Finals = NI \xrightarrow{m} (KI \xrightarrow{m} ContractNu)$
216.  $Final = NI \times ContractNu \times KI$
217.  $CPos = [Item\ 85\ on\ page\ 23]$
219.  $CHist = MSG^*$ <sup>45</sup>
220. ...

### value

211.  $attr\_Kind: Conveyor \rightarrow Kind$
211.  $attr\_Stowage: Conveyor \rightarrow Stowage$
215.  $attr\_TBU: Conveyor \rightarrow TBU$
215.  $attr\_TBL: Conveyor \rightarrow TBL$
213.  $attr\_SR: Conveyor \rightarrow SR$
214.  $attr\_SRIndex: Conveyor \rightarrow SRIndex$
216.  $attr\_Finals: Conveyor \rightarrow Finals$
217.  $attr\_CPos: Conveyor \rightarrow Position$
219.  $attr\_CHist: Conveyor \rightarrow CHist$

**axiom** [Routes of commensurate kind]

221. [left to the reader !]
218.  $\square \dots$  [left to the reader] ...

<sup>42</sup>Here we see a benefit from observing attributes, rather than explicitly defining the attributes of a part as a Cartesian of attributes.

<sup>43</sup>This service route concept reflects that the conveyor, at any time, may carry merchandise from many distinct contracts.

<sup>44</sup>The joint  $i:SRIndex$  and  $cpos:CPos$  may be a bit too much, but they come in conveniently for our subsequent formalizations.

<sup>45</sup>The messages are those directed at or emanating from conveyors

## 13.3 **Conveyor Commands.**

We refer to Sect. 16.8.2 on page 79.

## Chapter 14

# Logistics Companies

We remind the reader of Sect. 9.3 on page 42.

The purpose of a logistics company is to arrange of transportation. It does so in interaction between customers and conveyor companies.

The functions of logistics companies very much overlaps with some of the functions of conveyor companies.

An “extreme” example of a logistics company is that of a *travel agency* !

We shall, however, not pursue the logistics concept further – since its role is also played by conveyor companies.

## Chapter 15

# Intentional Pull, II

TO BE WRITTEN
---------------

## **Part IV**

# **A MULTI-MODE TRANSPORT: COMMANDS**

## Chapter 16

# Multi-mode Transport Commands

### 16.1 Events and Commands

We distinguish events from commands:

Events are perdurants. The “occur instantaneously”. At “their own” volition. In a state<sup>46</sup> and possibly cause a state change. Some events, the internal events, have their “root” in the [part] behaviour, hence “affect” the attributes of the underlying part. Other events, the external events, have their “root” “outside” the [part] behaviour, but may “affect” the attributes of the underlying part.

Commands are syntactic entities. Commands are “issued”<sup>47</sup> by part behaviours. They “occur” as the result of actions taken by [receiving] part behaviours. They have a syntax. They constitute a script facet<sup>48</sup> related to the part [behaviour]. They have a semantics. The semantics of commands is expressed by behaviour actions. We distinguish between directive commands and response commands. Directive commands are issued by a part behaviour and is directed at another part behaviour. Response commands are acted upon by a part behaviour in response to a command issued by another part behaviour. For both kinds of commands there are thus at least two behaviours involved in expressing their semantics.

### 16.2 Command Traces

In order to describe the very many commands it has proven useful to sketch a possible diagram of command traces. Figure 16.1 on the next page<sup>49</sup> shows schematically a possible trace of commands. The ordering, “i” in **ki**, shall indicate some temporal ordering of the issue of these commands.

We shall elaborate on the transport behaviours – with reference to Fig. 16.1 on the next page.<sup>50</sup>

- k1** After some preparatory work a sending customer inquires as to possible transport at a chosen conveyor or logistics company.
- k2** After some preparatory work the conveyor or logistics company replies to the inquiry.
- k3** After some preparatory work the customer places and order for transport.
- k4** After some preparatory work the chosen conveyor or logistics company confirms the order,
- k5** which the customer now [likewise firmly] accepts – with payments.
- k6** At some point logistics companies hand over customer orders to [respective] conveyor companies.
- k7** After some preparatory work these conveyor companies, one or more, select a the set of conveyors and inform them of the order, i.e., give them directives.
- k8** The conveyor company, at some time after [k7] informs the customer that a designated node is ready to accept its merchandises for transport – “on hold”, at a node.

---

<sup>46</sup>By ‘state’ we shall, in the context of perdurants, mean the value of all dynamic attributes of all behaviours.

<sup>47</sup>By “issued” we shall here mean that they are communicated, in the style of CSP communications by behaviours directed at other behaviours.

<sup>48</sup>For *facets* and *scripts* see [7, Chap. 8].

<sup>49</sup>In Fig. 16.1 on the following page we have “merged” the logistics company handling of commands with that of the conveyor company handling – as there is some “overlap” in their functionalities.

<sup>50</sup>That is: figures like Fig. 16.1 on the following page are not given a semantics. The “semantics” of Fig. 16.1 on the next page “transpires from the entire formal model of this report.

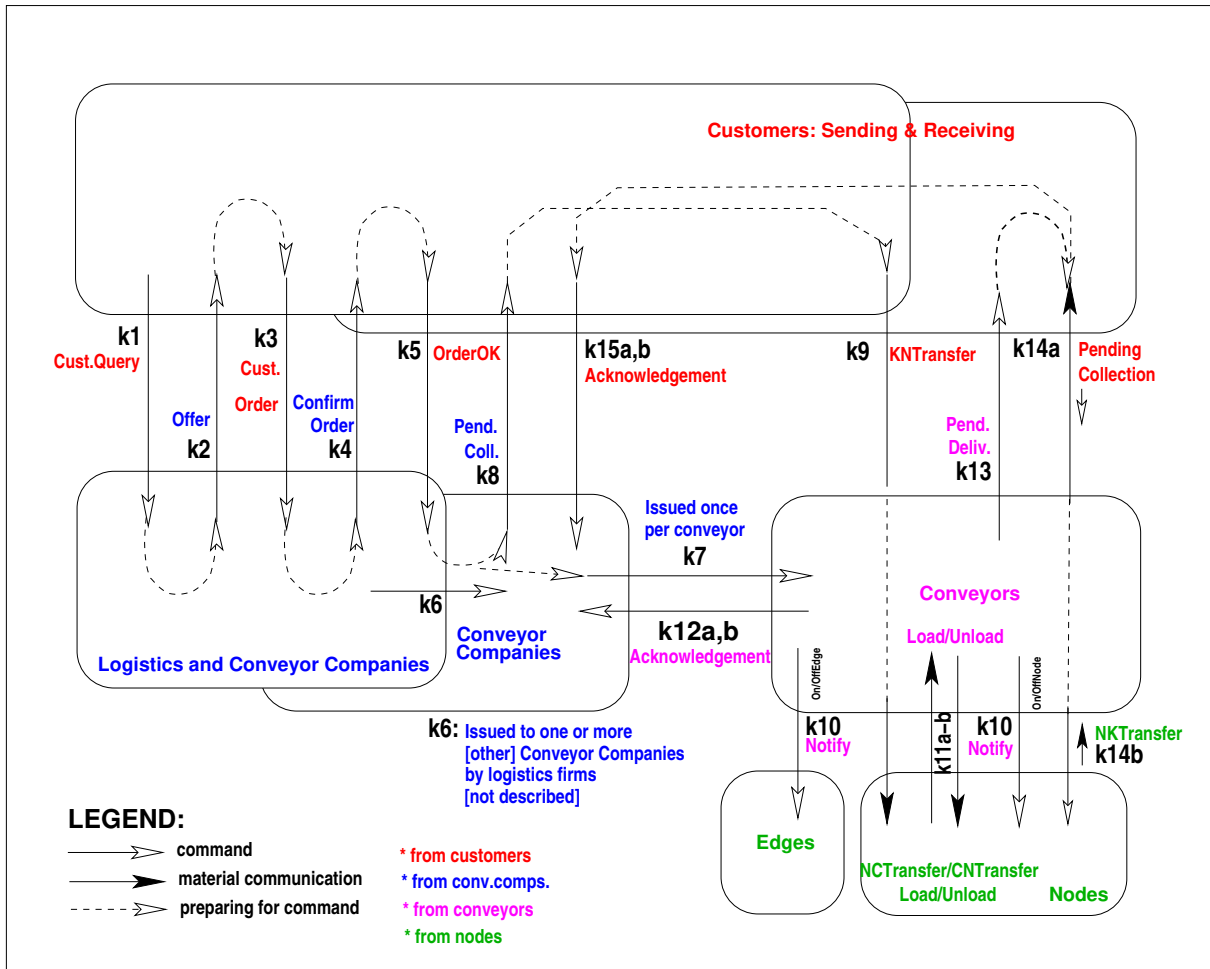

Figure 16.1: Command & Material Traces [→]

- k9** Having been so notified by a conveyor the customer delivers the merchandises, to be transported, at a node, to be “on hold” for the conveyor.
- k10** Conveyors, “on the move”, notify edges and nodes of their presence.
- k11** In synchronous communications conveyors exchange merchandises with nodes: either loading ([k11a]) or unloading ([k11b]).
- k12** Those conveyors inform their companies of transfers.
- k13** The “last” conveyor notifies the “end” customer receiver of pending arrival.
- k14** Having been notified, by the conveyor, the “end” customer receives the transported merchandises.
- k15** That customer informs the [final] conveyor company of the [final] transfer.

### 16.3 An Analysis

We now analyze Sect. 16.2 on the preceding page.

It seems tat there are four kinds of “commands”: *ab initio*, *deferred*, *triggered* and *cascaded*.

- **Ab Initio:** There is only one command of this category: the customer query command, [k1]. Customers, at their own instigation, that is, internal non-deterministically, decides to have some merchandises transported.
- **Deferred:** Most commands are of this category: they are implied by issue of other, that is, “previous” [k2] thus follows from [k1], [k3] from [k2], etc.

There is no guarantee that [k2] will occur. The conveyor (or logistics) company may simply ignore that it has received [k1], respectively [k3] may not occur in response to [k2]. Etcetera.

- **Triggered:** “Commands” [k11a] and [k11b] are not “directly issued”, external non-deterministically, “at some time” in response to [k7].

[k7], such as we small model it, shall result in conveyors having an appropriate attribute, the *to be loaded* and *to be unloaded*, containing such information as when conveyors at nodes shall *load* and *unload* merchandises – and when conveyors are **At** such **Nodes**, this attribute information is said to **trigger** these merchandise transfers.

- **Cascaded:** [k8] is issued either at the same time as [k7], or shortly thereafter. [k9] is issued when [k8] has been received – after which a first [k15] is issued.

## 16.4 Material and “Immaterial” Commands

Commands **k1-k8**, **k10**, **k13**, **k15** and **k18** are “immaterial” in that they “just” communicate information. Commands **k9**, **k11** and **k14** are “material” in that they, besides information (data) also communicate, i.e., physically transfer material, i.e., merchandises.

## 16.5 Abstracting an Essence of Transport

By “*abstracting an essence of transport*” we mean that a number of transport “details” are omitted for “the benefit” of emphasizing “other details”! For examples: (i) we omit details of the structure and contents of what is to be transported, (ii) keeping, somehow, details of who is sending, the address, by whom the merchandise is to be received, etc., (iii) omitting details of merchandise, identification, quantity, weight, value, etc., (iv) cost, payments, etc. In the description of commands, below, we therefore abstract “to the core” these commands – assuming that the various “actors”: the customers, the logistics and conveyor companies and the conveyors can otherwise, i.e., somehow “find out”!

## 16.6 Commands – A First View

As You see, there are many commands. In this section we shall “*take an abstract view of these*” before, in Sect. 16.8 we go into the detailing of these commands. This “abstract view” should then enable us to “design”, as it were, a systematic form and set of less abstract commands.

### 16.6.1 Customer Commands, I

222. **k1** Customers inquire either logistics companies or conveyor companies about many things, for example time-tables, cost, etc., for the transport of merchandises from one customer to another, etc.
223. **k3** Customers place orders, with either logistics companies or conveyor companies for the transport – according to some offers, **k2**, made by these.
224. **k5** Customers “signs” the **k4** offer.
225. **k9** Customers deliver merchandise to nodes.
226. **k15** Customers acknowledge receipt of merchandises.

#### type

222. [k1] CustQuery
223. [k3] CustOrder
224. [k5] OrderOK
225. [k9] CustDel
226. [k15] Acknowledgment

### 16.6.2 Conveyor Company Commands, I

- 227. **k2** Conveyor companies place an offer for transport in response to an inquiry, **k1**.
- 228. **k4** Conveyor companies OKs an order in response to an customer order, **k3**.
- 229. **k7** Conveyor companies inform conveyors of orders, **k4**, to be carried out.
- 230. **k8** Conveyor companies inform customers of pending collection of merchandises.

#### type

- 227. [k2] ConvCompOffer
- 228. [k4] ConvCompOrdOK
- 229. [k7] ConvCompConvDir
- 230. [k8] PendColl

### 16.6.3 Conveyor Commands, I

- 231. **k8** Conveyor notify customers of pending collection.
- 232. **k10** Conveyor notify edges and nodes of its presence.
- 233. **k11a-k11b** Conveyor transfers merchandises to and from node.
- 234. **k12** Conveyor acknowledges conveyor company of merchandise transfer.
- 235. **k13** Conveyor informs customer of pending delivery.

- 232. [k10] Notify
- 233. [k11a] CNTransfer
- 234. [k12] Acknowledgement
- 235. [k13] PendDel

• • •

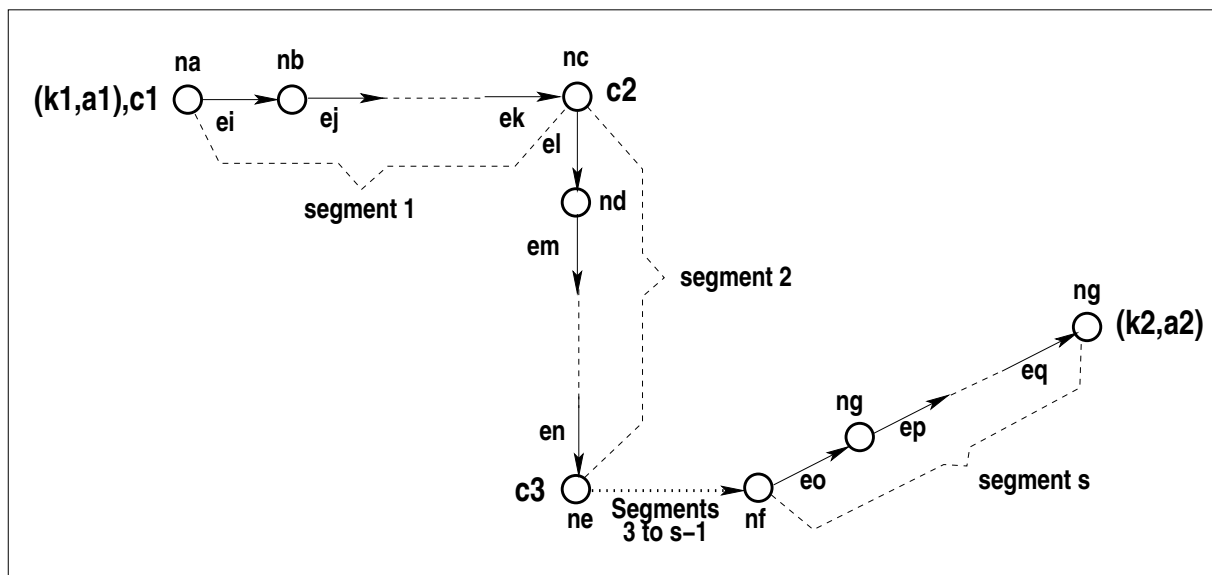

Conveyors collect and deliver merchandise not only from and to nodes, but also from and to other conveyors. Therefore the **k10–k15a-b**. sequence of commands also takes place between distinct conveyors.

### 16.6.4 Logistics Company Commands

We shall skip this section,

## 16.7 TR: Transport Routes

We may have “*abstracted too much*” in Sect. 16.6. For example, where in the conveyor company and logistics company to customer order OK commands is the information “hidden” that outlines the course of actions: which route to take, with which conveyors, at which approximate times ? That information may be formalized:

**Figure 16.2:** A Transport Route: k:kustomer, c:conveyor, a:address, n:node, e:edge

236. A *transport [route]* is a composite of
237. first a sending customer's identifier and place of pick-up ( $(k1, a1)$ );
238. then the storage: a non-empty set of unique identifiers of the merchandises transported – indexed by contract number;
239. followed by a sequence of one or more segments (**segment 1, segment 2, ..., segment n**)–
240. each segment beginning with a conveyor ( $c1, c2, ..., c3$ ) identifier, then a node identifier ( $na, nc, ..., ne$ ), and finally a non-empty edge-node-path –
241. an edge-node-path is sequence of alternating edge and node identifiers ( $\langle ei, nb, ej, ..., ek, nc \rangle$ );
242. finally ending with a receiving customer's identifier and place of delivery ( $k2, a2$ )).
243. The two addresses must be different  $a1 \neq a2$ .
244. The paths formed by edge-node-paths headed by a, i.e., the, node identifier must be paths of the transport net<sup>51</sup>,
245. and these paths must be of the same kind as the conveyor for those paths.
246. The time ordering is strictly ascending –
247. and the “end” node of one segment must match, i.e., be equal to the “beginning” node of the next segment.
248. The storage must be well-formed: no two contracts identify the same merchandises.
249. From a contract number one can observer, i.e., extract, the issuing conveyor company identifier.

**type**

236.  $TR = s\_sndr: (KI \times Addr)$
238.  $\times s\_cos: (ContractNu \xrightarrow{m} MI\text{-}set) \text{ axiom } \forall mis: MI\text{-}set \cdot mis \neq \{\}$
239.  $\times s\_sgl: Segment^* [\text{axiom } \forall sl: Segment^* \cdot sl \neq \langle \rangle]$
242.  $\times s\_rcvr: (KI \times Addr)$
240.  $Segment = TIME \times CI \times NI \times Edge\_Node\_Path$
241.  $Edge\_Node\_Path = (s\_ei: EI \times s\_ni: NI)^* \text{ axiom } \forall enp: Edge\_Node\_Path \cdot enp \neq \langle \rangle$
238.  $ContractNu$

**value**

249.  $xtr\_CKI: ContractNu \rightarrow CKI$

**axiom**

238.  $\forall tr: TR \cdot \text{let } cos = s\_cos(tr) \text{ in } \forall cnu: \text{dom } cos \cdot xtr\_MIs(cnu) = cos(cnu) \text{ end}$

**Wellformed Transports<sup>52</sup>****axiom** [Wellformed Transports]

243.  $\forall ((_, a1), _, sl, (_, a2)): TR \cdot a1 \neq a2 \wedge$
242.  $\forall seg: Segment \cdot seg \in elems\ sl \Rightarrow$
242.  $\forall (_, ci, ni, enp): Segment \cdot (ci, enil, ei) \in elems\ enp$
244.  $\wedge \langle ni \rangle^{enp} \in paths \wedge enil \in paths$
245.  $\wedge same\_kind(enp, ci)$
246.  $\wedge \forall i, i+1 \cdot \{i, i+1\} \subseteq inds\ sl \Rightarrow$
246.  $\text{let } (\tau_i, ci, ni, enp) = sl[i], (\tau_j, cj, nj, enpj) = sl[i+1] \text{ in } \tau_i < \tau_j$
247.  $\wedge s\_ni(enpi[|len\ enp|]) = nj \text{ end}$
247.  $\forall storage: (ContractNu \xrightarrow{m} MI\text{-}set) \cdot$
247.  $\forall cni, cnj: ContractNu \cdot \{cni, cnj\} \subseteq \text{dom } storage \wedge cni \sim cnj$
247.  $\Rightarrow storage(cni) \cap storage(cnj) = \{\}$

<sup>51</sup>Cf. Item 52 on page 16

<sup>52</sup>Axiom 243–247 must be carefully checked

### Auxiliary Functions

#### value

245. `same_kind: Edge_Node_Path × CI → Bool`  
 245. `same_kind(enpath,ci) ≡ ...` [Left to the reader]

An aspect of the transport routes, `tr:TR`, when a transport route has more than one segment, is that the node between two adjacent segments, serve as a repository for merchandises. A conveyor unloading merchandises destined for other, one or more, conveyors may not arrive when either or all of these conveyors have arrived<sup>53</sup>, so they deposit, put “on hold”, those merchandises. For respective kinds of nodes these “deposit holds” are, for example, called *bus stops* for kind **road**, *train station waiting rooms* for kind **rail**, *airport passenger lounges* for kind **air**, and *container terminals* for kind **sea**.

Segments (Item 240 on the facing page) are static descriptions of where conveyors are to move. Service Routes, SRs (Item 213 on page 60), are static descriptions of when conveyors are to move.

## 16.8 A Closer Analysis of Commands

We refer back to the overview of all commands given in Sect. 16.6.

### 16.8.1 Customer Commands, II

222. For a customer to formulate a proper query about possible transports such a query must contain the following information:

- (a) a unique, customer-chosen inquiry identification and
- (b) a query compound.

250. The query compound, it seems, should contain such information as:

- (a) name, address, and other such data that “pin-points”, “validates” the inquirer;
- (b) characterization of the merchandise to be transported: product information, quantity, total weight, total volume, total value [for insurance purposes], etc.;
- (c) time interval of transport;
- (d) from where to where;
- (e) expected cost frame; and, possibly, more !
- (f) Addresses are further unspecified.

#### type

222. `[k1] CustQuery ::`  
 249a. `QueryId`  
 249b. `× QueryComp`

250. `QueryComp =`  
 250a. `Addr`  
 250b. `× MInfo [ ... ]`  
 250c. `× TI [ = (TIME×TIME), axiom ∨ (ft,tt):TI•ft<tt ]`  
 250d. `× FT [ = NI×(NI×KI×AddrInfo), axiom ∨ (nf,(nt,__,__)):FT•nf≠nt ]`  
 250e. `× ExpCost`  
 250f. `Addr`

<sup>53</sup>The conveyor or logistics company, when preparing the offers, are assumed to make sure that there is appropriate time intervals between unloading and loading conveyors for relevant merchandises.

223. For a customer to formulate a proper order for a specific transport such a query must be based on the conveyor or logistics company offer to a query like that outlined in Item 250, above, the order must contain the following information:

- (a) the customer inquiry identification, and
- (b) a reference to the logistics or conveyor company contract number given in query reply.
- (c) Then more-or-less the same information, formulated as a compound, as given in the original query – which is also expected to be contained in the reply offer;
- (d) name, address, etc.,
- (e) merchandise information,
- (f) precise times.
- (g) from-to transport details,
- (h) the offered cost,
- (i) etc.

251. From a query identifier one can extract the customer identity.

#### type

```
223. [k3] CustOrd ::
250a.      QueryId
250b.      × ContractNu
250c.      × OrdrComp
```

```
250c. OrdrComp =
```

```
250d.      Addr
250e.      × MerchInfo
250f.      × TI
250g.      × FT
250h.      × Cost
250i.      × ...
```

#### value

```
251. xtr_KI: QueryId → KI
```

224. For a customer to OK a proposed transport the the customer must provide

- (a) the contract number,
- (b) the choice number,
- (c) payment.

```
224. [k5] OrderOK ::
251a.      ContractNu
251b.      × ChoiceNo
251c.      × Payment
```

224. For a customer to deliver the merchandises according to the contracted order the customer must provide

- (a) a reference to to the contract number and
- (b) the therein indicated number of actual merchandises !

#### type

```
224. [k9] KNTransfer ::
251a.      ContractNu
251b.      × M-set
```

252. [k15] A customer having received merchandises (from another customer via conveyors) at a node acknowledges this receipt by so informing the conveyor company.

**type**

252. [k15] Acknowledgment ::  $TIME \times ContractNu \times (NI \times KI)$

Observe that the first two commands and the last command were strictly “informational”, i.e., syntactic, whereas the Customer tDelivery command is “rather” physical; i.e., semantic: the command, so-to-speak, “embodies” an action, the manifest movement of volumes of possibly heavy material !

There may be other customer commands – such as inquiring as to the progress of an actual transport, etc. We leave that to the reader.

## 16.8.2 Conveyor Commands, II

The conveyor commands, first outlined in Sect. 16.6.3 on page 74, are now summarized and detailed. First we list their treatment in Sect. 16.6.3 on page 74.

231. **k8** Conveyor informs customer of pending collection.  
 232. **k10** Conveyor notifies edges and nodes of conveyor presence.  
 233. **k11** Conveyor transfers (loads [k11a], unloads [k11b]) merchandises.  
 234. **k12** Conveyor acknowledges conveyor company of merchandise transfer.  
 235. **k13** Conveyor informs customer of pending delivery.

231. [k8] PendColl  
 232. [k10] Notify  
 233. [k11a,b] Transfer = CTransfer | NCTransfer  
 234. [k12] Acknowledgment  
 235. [k13] PendDel

253. [k8] Conveyors inform either a customer of pending collection of merchandises.  
 They do so by simply mentioning the contract number and the set of unique identifiers of the merchandise to be collected.  
 254. [k10] Conveyors notify edges and nodes of their presence.

Conveyors transfer:

255. [k11a] load from a node.  
 256. [k11b] or unload merchandises to a node.

They do so by stating the contract number and presenting the set of merchandise to be transferred.

257. [k12] Conveyors, time-stamped, acknowledges its company of, and at the completion of a transfer, collection or delivery of merchandise. They do so by mentioning the contract number and the two “parties” to the transfer:  
 258. either a customer and a node, or a of conveyor and a node.  
 259. [k13] Conveyors inform customers of pending delivery (at a node).

**type**

253. [k8] PendColl ::  $(NI \times (ContractNu > MI\text{-}set))$   
 254. [k10] Notify ::  $AtNode \mid OnEdge$   
 255. [k11a] NCTransfer ::  $(ContractNu \times M\text{-}set)$   
 256. [k11b] CTransfer ::  $(ContractNu \times M\text{-}set)$   
 257. [k12] Acknowledgment ::  $TIME \times ContractNu \times FromTo$   
 258. FromTo =  $(NI \times CI) \mid (CI \times NI)$   
 259. [k13] PendDel ::  $(NI \times (ContractNu \times MI\text{-}set))$

### 16.8.3 Conveyor Company Commands, II

Review:

**type**

```

i227 π74. [k2] ConvCompOffer
i228 π74. [k4] ConvCompOrdOK
i229 π74. [k7] ConvCompConvDir

```

We now detail these.

260. An offer for transport must state

- (a) the conveyor company identity;
- (b) a contract<sup>54</sup> number;
- (c) refer to an inquiry, for example by stating its number or by repeated it; and
- (d) a set of zero, one or more choice number indexed offer-choices.

An offer-choice

- (e) a timed route of transport, and
- (f) a cost.

261. An OK, binding acknowledgment of an order must state

- (a) the conveyor company identity,
- (b) a contract number,
- (c) refer to an offer and choice number,
- (d) “repeats” the contracted timed route of transport,
- (e) and the cost.

262. The conveyor company information to be given to conveyors of orders, **k4**, state

- (a) the conveyor company identity;
- (b) a contract number and
- (c) the contracted time route of transport.

263. From Offer numbers, contract numbers and choice numbers one can extract the offering and contracting company’s identity

264. as well as the identity of the customer being offered and contracted.

**type**

```

260. [k2] ConvCompOffer :: CKI × ContractNu × QueryNu × (ChoiceNu  $\overline{m}$  OfferChoice)
260b. ContractNu
260d. ChoiceNu
260e. OfferChoice = TR × ost

```

```

261. [k4] ConvCompOrdOK :: CKI × ContractNu × ChoiceNu × TR × Cost

```

```

262a. [k7] ConvCompConvDir :: CKI × ContractNu × Segment

```

**value**

```

263. xtr_CKI: (OfferNu|ChoiceNu|ContractNu) → CKI
264. xtr_KI: (OfferNu|ChoiceNu|ContractNu) → KI

```

---

<sup>54</sup> – even though this may not result in a contract

### 16.8.4 Node Commands

Nodes, as behaviours, have now become reactive. They store contracted merchandises – “on hold between” conveyors. So they must react to conveyor commands requesting merchandises, unloaded, to be put “on hold” or fetched, to be loaded. They react by accepting and delivering merchandises from, respectively to conveyors and customers. To these requests node behaviours must react [immediately (?)]. These are the only transport commands that must be so synchronized<sup>55</sup>. All other transport commands are “buffered”<sup>56</sup>

265. [k14] Nodes transfer merchandises (from another customer via conveyors) from the ‘on-hold’ of a node to a customer.

**type**

265. [k14] `NKTransfer :: NI × ContractNu`

### 16.8.5 Edge Commands

There are no edge commands. Edge behaviours receive notifications from conveyors as to their presence on edges.

---

<sup>55</sup> **Alert:** Check that I actually describe so !

<sup>56</sup> **Alert:** Perhaps one should reconsider the customer to conveyor and conveyor to customer transfers of merchandises to also be synchronized.

**Part V**

**IDENTITIES**

## Chapter 17

# Identities

So far we have introduced a variety of identities:

- unique identities of endurants,
- query ‘numbers’,
- offer ‘numbers’,
- contract numbers,
- etc.

These are, of course, not identifiers nor numbers or numerals. They are abstract entities.

We can say a lot about these:

266. From the identity of a customer we can “extract” (i.e., “observe”) such things as the name of the customer, the address (road name & number, district name, city name, county name, country name, telephone ‘numbers’, e-mail addresses, etc., etc.).
267. From the identity of a conveyor we can ‘extract’ the identity of its owner: a conveyor company.
268. From a query ‘number’ we can extract the identity of the querying customer.
269. From offer, order and contract ‘numbers’ we can extract the identities of conveyor (logistics) company and customer identities.
270. From a contract number we can extract the set of merchandise identifiers “involved” in the identified contract.
271. From a contract number we can extract a waybill<sup>57</sup>,
272. From a contract number we can extract a bill-of-lading<sup>58</sup>.
273. From a contract number we can observe whether it ( i.e.,the waybill/bill-of-lading) represents a ticket for human “merchandise” (cf. Sect. 10.3 on page 45).
274. Et cetera.

**value**

266. `xtr_Name: KI→Name`
266. `xtr_Addr: KI→((RoadNam×Nat)×DisNam×CounNam×LandNam×PhonNu×Email×...)`
267. `xtr_CKI: CI→CKI`
268. `xtr_CI: QueryNu→CI`
269. `xtr_CKI: (OfferNu|OrderNu|ContractNu)→CKI`
269. `xtr_CI: (OfferNu|OrderNu|ContractNu)→CI`
270. `xtr_MIs: ContractNu→MI-set`

**type**

266. `RoadNam, DisNam, CounNam, LandNam, PhonNu, Email`
271. `WayBill`
272. `BoL`

**value**

271. `xtr_WayBill: CKI→WayBill`
272. `xtr_BoL: CKI→BoL`
273. `is_Ticket: (WayBill|BoL)→Bool`

MORE TO COME

<sup>57</sup>A waybill is a document issued by a carrier acknowledging the receipt of goods by the carrier and the contract for shipment of a consignment of that cargo. Typically it will show the names of the consignor and consignee, the point of origin of the consignment, its destination, and route [Wikipedia].

<sup>58</sup>A bill of lading (sometimes abbreviated as B/L or BoL) is a document issued by a carrier (or their agent) to acknowledge receipt of cargo for shipment. Although the term is historically related only to carriage by sea, a bill of lading may today be used for any type of carriage of goods. Bills of lading are one of three crucial documents used in international trade to ensure that exporters receive payment and importers receive the merchandise. The other two documents are a policy of insurance and an invoice.[a] Whereas a bill of lading is negotiable, both a policy and an invoice are assignable [Wikipedia].

# **A MULTI-MODE TRANSPORT: BEHAVIOURS**

# Chapter 18

## Multi-mode Behaviours

### Contents

18.1 Communication	89
18.2 Behaviour Signatures	90
18.3 Which Behaviours to Describe?	91
18.4 Multi-mode “Systems”	91
18.4.1 Multi-mode Domain Initialization	91
18.4.2 Multi-mode Domain Instantiation	92

### 18.1 Communication

275. There is a medium for synchronization of and communication between behaviours.
276. **comm** $\{\{ui,uj\}\} ! value$  expresses an event [an action]: the “output” of value, from the behaviour identified by ui towards the behaviour identified by uj.
277. **comm** $\{\{ui,uj\}\} ?$  expresses a value, i.e., the “input” of a value, from the behaviour identified by ui by the behaviour identified by uj.

#### channel

278.  $\{ \text{comm}\{\{ui,uj\}\} \mid ui,uj:UI \cdot \{ui,uj\} \subseteq \sigma_{uis} \} : MSG$

278. The **comm** channel declaration above expresses that this medium is “two-dimensional” and communicates (“mediates”) messages of type M.
279. Messages are timed commands
280. and the commands are those of customers, conveyor companies, logistics companies and conveyors.

#### type

279.  $MSG = (UI \times TIME \times UI)^{59} \times Command$

279.  $UI = KI \mid CKI \mid CI$

279. [k1]	Command = CustQuery	[Customer → Company]
279. [k3]	CustOrd	...
279. [k5]	OrderOK	...
279. [k15]	Acknowledgment	...
279. [k9]	KNTransfer	[Customer → Node]
279. [k14a]	PendColl	...
279. [k2]	ConvCompOffer	[Company → Customer]
279. [k4]	ConvCompOrdOK	...
279. [k8]	PendColl	...
279. [k7]	ConvCompConvDir	[Company → Conveyor]
279. [k12]	Acknowledgment	[Conveyor → Company]

279.	[k13]	PendDeliv	[Conveyor→Customer]
279.	[k11a]	CNTransfer	[Conveyor→Node]
279.	[k10]	Notify	...
279.	[k11b]	NCTransfer	[Conveyor→Edge]
279.	[k10]	Notify	...
279.	[k11b]	NCTransfer	[Node→Conveyor]
279.	[k14]	NKTransfer	[Node→Customer]

• • •

A core property of CSP is that behaviours both **synchronize** their behaviours and **exchange** messages, from one, **!**, to another, **?**.

## 18.2 Behaviour Signatures

We omit consideration of aggregate and merchandise behaviours. There are:

- |  |                               |
|--|-------------------------------|
| 281. the customer behaviours,          | 284. the conveyor behaviours, |
| 282. the logistics company behaviours, | 285. the edge behaviours, and |
| 283. the conveyor company behaviours,  | 286. the node behaviours.     |

In some other order their signatures are:

<b>value</b>	
281. customer: KI	[identifier]
281. → KM <sup>61</sup>	[mereology]
281. → (CustId × AddrInfo × ...)	[static attrs.]
281. → (Possess × OutReqs × CustHist) <b>Unit</b>	[progr. attrs.]
283. conv_comp: CKI →	[identifier]
283. → CKM	[mereology]
283. → (ConvCompInfo × ...)	[static attrs.]
283. → (Resources×Contracts×Orders×CurrBuss×PastBuss×CKHist) <b>Unit</b>	[progr. attrs.]
284. conveyor: CI	[identifier]
284. → CM	[mereology]
284. → (Kind × ...)	[static attrs.]
284. → (Stowage×TBU×TBL×SR×SRIndex×Final×CPos×CHist) <b>Unit</b>	[progr. attrs.]
282. logistics: LI →	[identifier]
282. → LM	[mereology]
282. → (LogisticsCompInfo × ...)	[static attrs.]
282. → (PastBusiness × CurrBusiness × LHist) <b>Unit</b>	[progr. attrs.]
285. edge: EI	[identifier]
285. → EM	[mereology]
285. → (EdgeKind × LEN × COST × ...)	[static attrs.]
285. → EHist <b>Unit</b>	[progr. attrs.]
286. node: NI	[identifier]
286. → NM	[mereology]
286. → (NodeKind × ...)	[static attrs.]
286. → (OnHold × NHist) <b>Unit</b>	[progr. attrs.]

<sup>59</sup>The triplet: (fui,t,tui) is subject to the following constraint, which we leave to the reader to formalize: if tui:KI then tui:CKI or tui:CI; if tui:CKI then tui:KI or tui:CI; if tui:CI then tui:KI or tui:CKI.

## 18.3 Which Behaviours to Describe ?

We treat the transcendently deduced behaviours of some, but not all, the manifest parts: customers, conveyor companies, but **not** their conveyor company offices **nor** their conveyor aggregates, but their conveyors. We omit, also treatment of Logistics companies as their “function” is “very much like, i.e., “overlapping” with, that of conveyor companies.

• • •

The arrangement of the [narrative & formal] descriptions is by enduring, i.e., part, type; but the “reading” of these should be by pairs: each pair represents an arrow in Fig. 9.1 on page 37, one of the pair represents the source of the arrow, the “sending” behaviour, the second of the pair represents the target of the arrow, the “receiving” behaviour,

## 18.4 Multi-mode “Systems”

We can initialize a domain, and we can instantiate a domain.

### 18.4.1 Multi-mode Domain Initialization

- 287. An initialization of a transport domain means the parallel composition of the
- 288. parallel composition of the initialization of all customer behaviours with the
- 289. parallel composition of the initialization of all conveyor company behaviours with the
- 290. parallel composition of the initialization of all conveyor behaviours with the
- 291. parallel composition of the initialization of all logistics behaviours with the
- 292. parallel composition of the initialization of all edge behaviours with the
- 293. parallel composition of the initialization of all node behaviours.

```

287. instantiation: Unit → Unit
287. instantiation() ≡
288.   || { customer(uid_K(k))
288.         (mereo_K(k))
288.         (attr_CustId(k),...)
288.         ([], {}, ⟨⟩)
288.         | k:K • k∈ks } [ks, see Item 132 on page 39]
288.   ||
289.   || { conv_comp(uid_CK(ck))
289.         (mereo_CK(ck))
289.         (attr_ConvCompInfo(ck),...)
289.         (attr_Resources(c), [], [], {}, {}, ⟨⟩)
289.         | ck:CK • ck∈cks } [cks, see Item 178 on page 52]
289.   ||
290.   || { conveyor(uid_C(c))
290.         (mereo_C(c))
290.         (attr_Kind(c),...)
290.         ([], [], [], attr_SR(c), 1, [], attr_Position(c), ⟨⟩)
290.         | c:C • c∈cs } [cs, see Item 180 on page 53]
290.   ||
291.   || { logistics( ... ) | ... } [see remark on page 111]
291.   ||
292.   || { edge(uid_E(e))
292.         (mereo_E(e))
292.         (attr_EdgeKind(e), attr_LEN(e), attr_COST(e),...)
292.         (⟨⟩)
292.         | e:E • e∈es } [es, see Item 26 on page 12]
292.   ||
293.   || { node(uid_N(n))
293.         (mereo_N(n))
293.         (attr_NodeKind(n),...)
293.         ([], ⟨⟩)
293.         | n:N • n∈ns } [ns, see Item 27 on page 12]

```

### 18.4.2 Multi-mode Domain Instantiation

```

287. instantiation: Unit → Unit
287. instantiation() ≡
288.   || { customer(uid_K(k))
288.       (mereo_K(k))
288.       (attr_CustId(k),...)
288.       (attr_Possess(k),attr_OutReqs(k),attr_CustHist(k))
288.       | k:K • k∈ks } [ks, see Item 132 on page 39]
288.   ||
289.   || { conv_comp(uid_CK(ck))
289.       (mereo_CK(ck))
289.       (attr_ConvCompInfo(ck),...)
289.       (attr_Resources(c),attr_Contracts(ck),attr_Orders(ck),
289.       attr_CurrBuss(ck),attr_PastBuss(ck),attr_CKHist(ck))
289.       | ck:CK • ck∈cks } [cks, see Item 178 on page 52]
289.   ||
290.   || { conveyor(uid_C(c))
290.       (mereo_C(c))
290.       (attr_Kind(c),...)
290.       (attr_Stowage(c),attr_TBU(c),attr_TBL(c),attr_SR(c),
290.       attr_SRIndex(c),attr_Final(c),attr_Position(c),attr_CHist(c))
290.       | c:C • c∈cs } [cs, see Item 180 on page 53]
290.   ||
291.   || { logistics( ... ) | ... } [see remark on page 111]
291.   ||
292.   || { edge(uid_E(e))
292.       (mereo_E(e))
292.       (attr_EdgeKind(e),attr_LEN(e),attr_COST(e),...)
292.       (attr_EHist(e))
292.       | e:E • e∈es } [es, see Item 26 on page 12]
292.   ||
293.   || { node(uid_N(n))
293.       (mereo_N(n))
293.       (attr_NodeKind(n),...)
293.       (attr_OnHold(n),attr_NHist(n))
293.       | n:N • n∈ns } [ns, see Item 27 on page 12]

```

We refer to Sect. 7.5 on page 32 for a first example of domain initialization.

# Chapter 19

## Customer Behaviours

### Contents

19.1	<b>Main Behaviour</b>	<b>93</b>
19.1.1	Overall Behaviour	93
19.1.2	Overall Reactive Behaviour	94
19.2	<b>Subsidiary Behaviours</b>	<b>94</b>
19.2.1	Proactive Behaviours	94
19.2.1.1	[k1] Customer Issues Query	94
19.2.2	Reactive Behaviours	95
19.2.2.1	[k3] Customer Issues Order	95
19.2.2.2	[k5] Customer Accepts Offer	95
19.2.2.3	[k9] Customer Delivers Mercandises	96
19.2.2.4	[k14a-b,k15b] Customer Requests & Receives Mercandises	96

### 19.1 Main Behaviour

#### 19.1.1 Overall Behaviour

294. The customer internal non-deterministically alternates between being

- (a) a private entity, doing whatever,  
or possibly
- (b) [k1]<sup>62</sup> querying conveyor or logistics companies about a possible transport;
- (c) [k3] examining a conveyor or logistics company offer;
- (d) [k5] accepting an offer from a conveyor or logistics company;
- (e) [k9] delivering merchandises to nodes;
- (f) [k14] requesting contracted onhold merchandises from nodes, and
- (g) external non-deterministically possibly receiving messages from conveyor companies or logistics companies, conveyors, or nodes ([k2,k4,k8,k13,k14]).

u The [k1] query is pivotal. It “sets everything else in motion”. Responses from the conveyor company are “temporarily stored”, cf. *customer receives messages*, i.e., *cust\_receiv\_messages*, Item 294g. “Storage” is in the form of an additional behaviour argument.

#### value

```
294. customer(ki)(cm)(kid,kaddr)(po,or,ch) ≡
294a. ...
294b. [k1]  || cust_issues_query(ki)(cid,...)(...)(po,or,r,ch)
294c. [k3]  || cust_issues_order(ki)(cid,...)(...)(po,or,r,ch)
294d. [k5]  || cust_order_OK(ki)(cid,...)(...)(po,or,r,ch)
294e. [k9]  || cust_delivers_merchandises(ki)(cid,...)(...)(po,or,r,ch)
294e. [k14] || cust_requests_merchandises(ki)(cid,...)(...)(po,or,r,ch)
294g.      || cust_receives_messages(ki)(cid,...)(...)(po,or,r,ch)
```

<sup>62</sup>The bracketed numbers refer to those of Fig. 16.1 on page 72.

### 19.1.2 Overall Reactive Behaviour

295. The external non-deterministic reception of messages, **msg**:<sup>63</sup> MSG, proceed as follows:

- (a) Customer awaits messages<sup>64</sup> from either conveyor companies or conveyors.
- (b) Customers “remember” these messages as outstanding requests. They will be handled by [recursively] iterated invocations of the conveyor behaviour !

So we “handle” that “lastly” listed behaviour “first” !

**value**

```
295. cust_receives_messages(ki)(cid,...)(...)(po,or,r,ch) ≡
295a.   let msg = [] { comm[k1,ui]? | ui ∈ ckis∪cis } in
295b.   customer(ki)(cid,...)(...)(po,or∪{(k1,\tida,ui),msg},r,<msg>^ch) end
```

The “handling” of the orders, or “buffered” are defined in the ‘Reactive Behaviours’ subsections:

- Customer Issues Order [k3], Sect. 19.2.2.1, item 297 on the next page;
- Customer Accepts Offer [k5] (order OK), Sect. 19.2.2.2, item 297 on the facing page;
- Customer Delivers Mercandises [k9], Sect. 19.2.2.3, item 298 on page 96; and
- Customer Requests & Receives Merchandises [k14a-b,k15b], Sect. 19.2.2.4, item 299 on page 96.

## 19.2 Subsidiary Behaviours

### 19.2.1 Proactive Behaviours

#### 19.2.1.1 [k1] Customer Issues Query

296. [k1] The customer decides

- (a) to inquire, with some conveyor or logistics company, with a selected query command<sup>65</sup>,
- (b) which it then communicates to the conveyor company or logistics company, updates its outstanding requests and augments its history,
- (c) whereupon it resumes being a customer.

This query action [k1] is “matched” by the suggest offer action [k2] Sect. Suggest Offer]20.3.1 on page 99; cf. formula lines 296b and 302d on page 99.

```
296. cust_issues_query(ki)(cid,...)(...)(po,or,ch) ≡
296a.   let (coli,mk_CustQuery(qi,qc)) = sel_q(ki,(cid,...),(...),(po,or,ch)) in
296a.   let msg = ((ki,record TIME(),coli),mk_CustQuery(qi,qc)) in
296b.   comm[{ki,coli}] ! msg; [k1]
296c.   customer(ki)(cid,...)(...)(po,or∪{msg},<msg>^ch) end end

296a.   sel_q: KI×(CustId×AddrInfo×...)× ..
296a.         ×(Posses×OutReqs×CustHist) → CustInq
296a.   sel_q(ki,(cid,ai,...),(...),(po,or,ch)) ≡ ... see footnote 65 pg 94
```

<sup>63</sup>We have emphasized the **message** arguments as these play a pivotal role in the behavior interaction.

<sup>64</sup>These messages are either [k4] ConvCompOffers, [k8] ConvCompOrderOK, [k9] PendColl, [k13] ConvCustPendDel, [k14] NKTransfer messages.

<sup>65</sup>— we leave unspecified how that query is formed from the basis of the customer attributes

## 19.2.2 Reactive Behaviours

### 19.2.2.1 [k3] Customer Issues Order

297. [k3] If there is an ongoing (or outstanding) conveyor company offer

- (a) then the customer selects a suitable one. If there is not such the choice number is forced to 0.
- (b) Time is recorded.
- (c) If the customer does not finds a suitable offer
- (d) it so informs the conveyor company.
- (e) Else it likewise informs the conveyor company of order and choice number.
- (f) Whereupon it resumes being a customer.<sup>66</sup>

This issues\_order action [k3] is “matched” by the confirm\_order action [k4] Sect. Confirm Order]20.3.2 on page 99.

**value**

```

297.  cust_issues_order(ki)(cid,ai,...)(...)
297.      (po,{((cki,t,ki),mk_ConvCompOffer(on,t,choices))67}Uor,ch) ≡
296a.  let (cn,offer) = select_offer(choices) in
296c.  let msg = ((ki,record TIME(),cki),if cn=0
296c.      then mk_OrderOK(on,no)
296c.      else mk_OrderOK(on,cn,offer) end) in
296d.  comm[{cid,cki}] ! msg; [k3]
296f.  customer(ki)(cid,ai,...)(...)(po,or,<msg>^ch) end end

```

### 19.2.2.2 [k5] Customer Accepts Offer

297. Customers

- (a) examine transport company offers: the examine analysis function is left to Your imagination; the status value is either a **no**, or is **OrderOK**.
- (b) A time-stamped message to that effect is communicated to the conveyor company.
- (c) And the customer resumes being so.

This customer\_order\_OK action [k5] is “matched” by the conveyor\_directives action [k7] Sect. Conveyor Directives]20.3.3 on page 100. And also the pending\_collection action [k8] Sect. Pending Collection]20.3.4 on page 101.

```

297.  cust_order_OK(ki)(cid,...)(...)
297.      (po,{(ki,τ,cki),m:mk_ConvCompOffer(cki69,cnu,qno,offers)}Uor,ch) ≡
297a.  let okonok = examine(ki)(cid,...)(...)(po,{(ki,τ,cki),m}Uor,ch) in
297b.  let msg = ((ki,TIME,cki),mk_OrderOK(okonok)) in
297b.  comm[{cid,cki}] ! msg;
297c.  customer(ki)(cid,...)(...)(po,or,<msg>^ch) end end

```

<sup>66</sup>We have used some informal notation, i.e., [orderOK=]

<sup>67</sup>Note the formal argument “trick”: If the ongoing\_requests argument contains an element, ConvCompOffer(on,t,choices), then the cust\_accept\_offer behaviour applies. If it does not, then **skip**!

<sup>69</sup>The two argument ckis are/must be [!] identical.

## 19.2.2.3 [k9] Customer Delivers Merchandises

298. [k9] Customer delivers merchandises:

- (a) collecting the identified merchandises;
- (b) composing messages to node and contracting conveyor company;
- (c) then transferring the merchandises to the identified node;
- (d) informing the contracting conveyor company; and
- (e) finally resuming being a customer.

This delivery action [k9] is “in consequence” of the pending collection action [k8] Sect. Pending Collection]20.3.4 on page 101.

**value**

```

298. cust_delivers_merchandises(ki)(cid,ai,...)(...)
298.      (po,{mk_PendColl(cki,on,mis,ni)}∪or,ch) ≡
298a.      let ms = {m|m:M·m∈po∧uid_M(m)∈mis}, τ = record TIME() in
298b.      let msg1 = ((ki,τ,ni),mk_KNTransfer(on,ms)),
298b.      msg2 = ((ki,,τ,cki),mk_Acknowledgment(τ,cnu,(ki,ni))) in
298c.      [k9] (comm[{ki,ni}]! msg1
298d.      [k15a] || comm[{ki,cki}]! msg1);
298e.      customer(ki)(cid,ai,...)(...)(po\ms,or,{msg1,msg2}^ch) end end

```

## 19.2.2.4 [k14a-b,k15b] Customer Requests &amp; Receives Merchandises

299. [k14a] Customers are ready to receive merchandises once a message of pending delivery has been received from a conveyor.

- (a) [k14a] They can therefore accept such a delivery notice;
- (b) concocts an acknowledgment to the conveyor company,
- (c) [k15b] communicates this to the conveyor company,
- (d) whereupon it resumes being a customer.

This cust\_requests\_merchandises action [k14] is “matched” by the node action Sect. Main Behaviour]24.3 on page 116; cf. formula lines 299a and 323 on page 116.

**value**

```

299. cust_requests_merchandises(ki)(cid,ai,...)(...)
299.      (po,{(ci,t,ki),mk_PendDeliv(ci,cnu,mis)}∪or,ch) ≡
299b.      [k14a] comm[{ki,ni}]! mk_((ki,record TIME(),ni),PendColl(ni,(cnu,mis)))70;
299a.      [k14b] let mk_NKTransfer(cms) = comm[{ki,ni}]?71 in
299c.      [k15b] comm[{ki,cki}]! mk_Acknowledgment(record TIME(),cnu,(ci,ki)) ;
299d.      customer(ki)(cid,ai,...)(...)(po∪∪rng cms,or,{ms,msg}^ch) end

```

<sup>70</sup>Observe that the received message ki [in (cki,t,ki)] must match the formal argument ki. This informative communication is symbolized by the “open, white arrowhead” of the [k14] “double arrow” in Fig. 16.1 on page 72.

<sup>71</sup>This material communication is symbolized by the “black arrowhead” of the [k14] “double arrow” in Fig. 16.1 on page 72.

20.3.1 [k2] Suggest Offer . . . . .	99
20.3.2 [k4] Confirm Order . . . . .	99
20.3.3 [k7] Conveyor Directives . . . . .	100
20.3.4 [k8] Pending Collection . . . . .	101

---

### 20.1 Main Behaviour

300. Conveyor companies non-deterministically alternates between

- (a) being “themselves”, sorting out daily, “internal” operations,

internal non-deterministically issuing

- (b) [k2] (i.e., suggesting) offers,
- (c) [k4] order confirmations,
- (d) [k7] messages to conveyors about transports and
- (e) [k8] pending collection;

external non-deterministically awaiting

- (f) [k1] queries from customers, [k3] orders, [k5] sign-off on orders, or [k12,k15] acknowledgments of merchandise transfers.

```

300. conveyor_company(cki)(me)(info)(res,co,ors,cb,pb,ckh) ≡
300a.    ...
300b.    [k2]    [] suggests_offer(cki)(me)(info)(res,co,ors,cb,pb,ckh)
300c.    [k4]    [] confirms_offer(cki)(me)(info)(res,co,ors,cb,pb,ckh)
300d.    [k7]    [] informs_conveyors(cki)(me)(info)(res,co,ors,cb,pb,ckh)
300e.    [k8]    [] pending_collection(cki)(me)(info)(res,co,ors,cb,pb,ckh)
300f.    [k12,k15] [] awaits_msg(cki)(me)(info)(res,co,ors,cb,pb,ckh)

```

## 20.2 Main Reactive Behaviour

301. The conveyor company external non-deterministic reception of messages, i.e., responses, proceed as follows:

- (a) The conveyor company awaits responses from either customers or conveyors.<sup>72</sup>
- (b) If the message
- (c) is an acknowledgment, [k12,k15], of merchandise transfers,
- (d) then the `contracts` attribute is updated accordingly and
- (e) the conveyor company resumes being so,
- (f) else the conveyor company resumes being so, with updated `current business`,

```

301. awaits_msg(cki)(me)(info)(res,co,ors,cb,pb,ckh) ≡
301a.    let msg : ((koci,τ,cki),cmd)
301a.    = [] { comm [cci,koci] | koci : (KI|CI) • koci ∈ kis ∪ cis73 } in
301b.    case msg of
301c.        (ui,τ,cki),mk_Acknowledgment(τ,cnu,(ui,uj))
301d.        → let co' = upd_contracts(co,mk_Acknowledgment(τ,cnu,(ui,uj))) in
301e.            conveyor_company(cki)(me)(info)(res,co',ors,cb,pb,⟨msg⟩^ckh) end
301f.        _ → conveyor_company(cki)(me)(info)(res,co,ors,cb ∪ msg,pb,⟨msg⟩^ckh)
301.    end end

301d. upd_contracts: Contracts × Acknowledgment → Contracts
301d. upd_contracts(co,(τ,cnu,ft)) ≡ ⟨(τ,cnu,ft)⟩^con

```

<sup>72</sup>These responses are either [k1] customer queries, [k3] customer orders, [k5] customer order confirmation (and payment), or [k12,k15] conveyor and customer acknowledgment of merchandise transfers. Any other messages will be ignored

<sup>73</sup>*kis* and *cis* were defined in Items 167 on page 48 and 76 on page 22, respectively.

## 20.3 Subsidiary Behaviours

### 20.3.1 [k2] Suggest Offer

302. The conveyor company, with a customer query in its “in-basket”: current business, decides

- (a) to calculate an offer, commensurate with the query –
- (b) while updating the Offers and Orders attributes –
- (c) to form this offer into a commands, and to
- (d) communicate this offer to the inquiring customer,
- (e) updates its “past business” and history, and
- (f) resumes being a conveyor company.

This suggest offer action [k2] is “matched” by the query action [k1] Sect. Customer Issues Query]19.2.1.1 on page 94; cf. formula lines 296b on page 94 and 302d.

```

302.    suggests_offer(cki)(me)(info)
302.    (res,co,ors,msg:{{{cki,τ,ki},mk_CustQuery(qi,qc)}}∪cb74,pb,ckh) ≡
302a.    let offer:ConvCompOffer
302a.    = calc_offer(cki,res,co,ors,cb,pb,ckh)(mk_CustQuery(qi,ic)) in
302b.    let (res',ors') = update_res_and_ors(res,ors)(offer),
302c.    msg = ((cki,record TIME(),ki),offer) in
302d. [k2] comm[{{cki,ki}}]! msg;
302e.    let pb' = pb∪{msg}, ckh' = ⟨msg⟩^ckh in
302f.    conveyor_company(cki)(me)(info)(res',co,ors',cb,pb',ckh') end end end
301.    post: commensurate_query_offers(mk_CustQuery(ki,iq,ic),offer)

```

```

302.    commensurate_query_offers: ...
302a.    calc_offer(...) ≡ ...
302b.    update_res[sources]_and_or[der]s ...

```

### 20.3.2 [k4] Confirm Order

(300c) The conveyor company with an OrderOK, decides to handle that:

- (a) If the order was not OK'ed then it does nothing,
- (b) else it cashes the payment<sup>76</sup> –
- (c) updates its current business and history,
- (d) and resumes being a conveyor company.

This confirm order action k4 is “matched” by the customer accepts offer action k5 Sect. Customer Accepts Offer]19.2.2.2 on page 95.

```

300c.    confirms_offer(cki)(me)(info)
300c.    (res,co,ors,{msg:((ki,t,cki),nok)}∪cb,pb,ckh) ≡
302a.    conveyor_company(cki)(me)(info)(res,co,ors,cb,{msg}∪pb,ckh)

300c.    confirms_offer(cki)(me)(info)
300c.    (res,co,ors,{msg:((ki,t,cki),mk_OrderOK(con,cn,pay))}∪cb,pb,ckh) ≡
302b.    [payment is registered ;]
302c.    let ors' = update_orders(co,ors)(msg), ckh' = ⟨pay⟩^ckh in
302d.    conveyor_company(cki)(me)(info)(res,co,ors',cb,pb∪{msg},ckh') end

```

<sup>74</sup>See footnote 67 on page 95.

<sup>76</sup>The receipt and registration of payments, etc., etc., is a role for the conveyor company office.

303. The `update_orders` [auxiliary] function

- (a) examines the choice identified `offer`, and  
the identified choice, `tr`, and  
updates the contract to now only reflect that choice.

The “stashing” of `msg` in the “past business book” serves to remind the conveyor company to – sooner or later – issue [k7]. See next!

```
303.  update_orders:  Orders → MSG → Orders
303.  update_orders(ors)((ki,t,cki),mk_OrderOK(cnu,cn,pay)) ≡
303a.      ors \ {cn} ∪ [cn ↦ (ors(cn))(cnu)]
```

### 20.3.3 [k7] Conveyor Directives

(300d) “Sooner or later” the conveyor company reacts on the **orderOK** and

304. informs the one or more conveyors to be involved in the contracted transport.

- (a) If the **orderOK** was a **no** it does nothing, i.e., resumes being a conveyor company.
- (b) Else it decomposes the possibly multiple element segment list into separate conveyor company to conveyor directives,
- (c) communicates these to each involved conveyor, and
- (d) updates its history, and resumes being a conveyor company.

This conveyor directives action [k7] is “matched” by the [k5] action customer accepts offer Sect. Customer Accepts Offer]19.2.2.2 on page 95; cf. formula lines 297b on page 95 and 304c.

```
300d.  informs_conveyors(cki)(me)(info)
304.    (res,co,ors,cn,pb ∪ {((ki,t,cki),mk_OrderOK(cnu,chn,status))},ckh) ≡
304a.    if status = no axiom status ≠ orderOK
304a.    then conveyor_company(cki)(me)(info)(res,co,ors,cn,pb,ckh77)
304b.    else let (status,tr) = (co(con))(chn) in
304b.    let dir1 = elems construct_dirs(ki,record TIME(),cki,cnu,tr) in
304c.    {comm[{cki,ci}] ! dir1:ConvDir•dir ∈ elems dir1 ∧ dir = ((cki,t,ci),_)} end end
304d.    conveyor_company(cki)(me)(info)(res,co,ors,cn,pb,(dir1|dir ∈ dirs) ^ ckh) end
```

305. The `construct_dirs` function

- (a) from each segment from the contracted, `con` and chosen, [choice no.] `chn`, transport offer, it constructs a *convoy directive*,
- (b) and assembles into a Conveyor Company to Conveyor Directive command.
- (c) A *convoy directive* is a pair of *unload* and *load* directives.
- (d) An unload [load] directive is a quadruple of `TIME`, a node identifier, a contract number and a set of merchandise identifiers.

**type**

```
305c.  ConvDir = Unload × Load × [Final]78
216.  Finals = NI  $\overrightarrow{m}$  (ContractNu  $\overrightarrow{m}$  KI)
216.  Final = (NI × (ContractNu × KI)) | not_final
305d.  Load, Unload = TIME × NI × ContractNu × MI-set
```

**value**

```
305.  construct_dirs: KI × TIME × CKI × ContrNo × TR → ConvDir*
305.  construct_dirs(ki,t,cki,cnu,((fki,faddr),mis,sgl,(tki,taddr))) ≡
305a.    let dir1 = ⟨ extract_dir(sgl[i],con,mis,i,len sgl,tki) | i: Nat.1 ≤ i ≤ len sgl ⟩ in
305b.    ⟨ ((cki,t,ci),ConvDir(dir1[i],not_final)) | i: Nat.1 ≤ i < len sgl ⟩
305b.    ^ ⟨ ((cki,t,ci),ConvDir(dir[len sgl],(ni,(cnu,ki)))) ⟩ end
```

<sup>77</sup> **Alert:** I am not sure with what, if anything, to prefix the history with is OK. I was not ready to think about it when I wrote it, March 31, 2025, 16:01

306. The `extract_directive` function applies to a segment, contract number, a set of merchandise identifiers, the index of the segment list being examines, the length of that list, and the “end” customer identifier.

- (a) If the current index is less than the segment list, the no “final” is issued, just a pair of unload/loads.
- (b) Otherwise a final: `nj, cnu, ki`, the identifier of the last node where the contracted merchandises will be held for the customer `ki`.

**type**

306. `Segment = TIME × CI × NI × (EI|NI)*`

**value**

306. `extract_dir: Segment × ContractNu × MI-set × Nat × Nat × KI`

306. `→ ((UnLoad×Load)×Final)`

306. `extract_dir(sg:(t,ci,ni,enl^⟨nj⟩),cnu,mis,i,li,ki) ≡`

306a. `if i<li then (((t,ni,con,mis),(t,nj,cnu,mis)),nil)`

306b. `else (((t,ni,con,mis),(t,nj,cnu,mis)),(nj,cnu,ki)) end`

306. **pre:** the edge-node identifier list is not empty, i.e.,  $\neq \langle \rangle$

We apologize for the somewhat “tricky” functions: `construct_dirs` and `extract_dir`<sup>79</sup>.

#### 20.3.4 [k8] Pending Collection

307. At some time conveyor companies react to customers’ [k5] order OK (accepts offer) messages

- (a) by replying with a pending collection message –
- (b) whereupon the resume being conveyor companies,

This pending collection action [k8] is “in consequence” of the [k5] action order OK (accepts offer) Sect. Customer Accepts Offer]19.2.2.2 on page 95.

**value**

307. `pending_collection(cki)(me)(info)`

307. `(res,co,ors,{((ki,τ,cki),mk_OrderOK(ni,cnu,chn,orderOK))}∪cb,pb,ckh) ≡`

307a. **let** `msg = mk_((cki,record TIME(),ki),(PendColl(ni,(cnu,mis)))) in`

307a. **comm**[{cki,ki}]! `msg`;

307b. `conveyor_company(cki)(me)(info)(res,co,ors,cb,pb,⟨msg⟩^ckh) end`

<sup>78</sup>The type expression [T] stands for T|nil

<sup>79</sup>Most other function definitions are, in our opinion, straightforward

21.3.1.4 Conveyor at Node . . . . .	108

### 21.1 Earlier Treatment

In Sect. 7.4.1 on page 28 we first treated conveyor behaviours:

**Signatures then:**

**value**

l104 π28. conveyor:  $CI \rightarrow CM \rightarrow (Kind \times Routes) \rightarrow (CurrRoute \times CPos \times CH)$  **Unit**

**Behaviour, then at node:**

**value**

l105 π28. conveyor(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$   
l105a π28. conveyor\_change\_route(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  
l105b π28.  $\parallel$  conveyor\_remains\_at\_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  
l105c π28.  $\parallel$  conveyor\_enters\_edge(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  
l105d π28.  $\parallel$  conveyor\_stops\_at\_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)

l106 π29. conveyor\_change\_route(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$   
l106a π29. **let**  $\tau = \text{record\_TIME}()$ ,  
l106b π29. ncr = select\_next\_route(ni,routes),  
l106d π29.  $ch' = \langle (\tau, ni) \rangle^{ch}$  **in**  
l106c π29. **comm**[{ci,ni}] !  $(\tau, ci)$  ;  
l106e π29. conveyor\_at\_node(ci)(cm)(k,routes)(ncr,AtNode(ni),ch') **end**

l106b π29. selects\_next\_route:  $NI \times Routes \rightarrow CurrRoute$   
l106b π29. selects\_next\_route(ni,routes) **as**  $ncr \cdot ncr \in routes \wedge \text{hd } ncr = ni$

**Behaviour, then on edge:**

```

l111  $\pi$ 30. conveyor(ci)(cm)(k,routes)
l111  $\pi$ 30.      (cr,mk_OnEdge(nuif, (f,e),nuit),ch)  $\equiv$ 
l111a  $\pi$ 30.      conveyor_moves_on_edge(ci)(cm)(k,routes)
l111a  $\pi$ 30.      (cr,mk_OnEdge(nuif, (f,e),nuit),ch)
l111c  $\pi$ 30.       $\parallel$  conveyor_stops_on_edge(ci)(cm)(k,routes)
l111c  $\pi$ 30.      (cr,mk_OnEdge(nuif, (f,e),nuit),ch)
l111b  $\pi$ 30.       $\parallel$  conveyor_enters_node(ci)(cm)(k,routes)
l111b  $\pi$ 30.      (cr,mk_OnEdge(nuif, (f,e),nuit),ch)

l107  $\pi$ 29. conveyor_remains_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
l107a  $\pi$ 29.      let  $\tau = \text{record\_TIME}()$  in
l107b  $\pi$ 29.      comm[{ci,ni}] ! ( $\tau$ ,ci);
l107c  $\pi$ 29.      conveyor(ci)(cm)(k,routes)(cr,AtNode(ni),( $\tau$ ,ni)ch) end

l108  $\pi$ 29. conveyor_enters_edge(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
l108a  $\pi$ 29.      let  $\tau = \text{record\_TIME}()$  in
l108b  $\pi$ 29.      ( comm[{ci,ni}] ! ( $\tau$ ,ni)  $\parallel$  comm[{ci,ni}] ! ( $\tau$ ,hd cr) );
l108c  $\pi$ 29.      let ei = hd cr in let {ni,ni'} = mereo_E(retr_edge(ei)(es)) in
l108c  $\pi$ 29.      let cpos = onEdge(hd cr,(ei,(ni,f,ni),ni')) in
l108e  $\pi$ 29.      conveyor(ci)(cm)(k,routes)(cr,cpos,( $\tau$ ,ni)ch) end end end end

l109  $\pi$ 30. conveyor_stops_at_node(ci)(cm)(k,routes)(cr,AtNode(ni),ch)  $\equiv$ 
l110  $\pi$ 30.      let  $\tau = \text{record\_TIME}()$  in
l110  $\pi$ 30.      comm[{ci,ni}] ! ( $\tau$ ,ci) ;
l109  $\pi$ 30.      stop end

```

## 21.2 Main Behaviour

In the context of customers and logistics and conveyor companies, as illustrated by Fig. 16.1 on page 72, conveyors, i.e., their behaviour, are a bit more intricate !

308. Conveyors non-deterministically alternates between

(a) being themselves,

or external non-deterministically receiving

(b) [k7] directives from conveyor companies – their own or other,

(c) and then handling these messages,<sup>80</sup>

and internal non-deterministically sending messages

(d) [k10] notifying edges and nodes of their presence,

(e) [k12] and acknowledgments of transfer of merchandises from and to customers and nodes.

When not responding to and handling messages from other behaviours ([k7] conveyor companies, or [k9] customers),

(f) a conveyor is either at a node, possibly unloading or loading merchandises, or

(g) along, i.e., on, an edge.

```

308.   conveyor(ci)(cm:(uis,ckis,kis,cis))(k,...)
308.   (stow,tbu,tbl,sr,idx,finals,pos,ch) ≡
308a.   ... conveyor(ci)(cm:(uis,ckis,kis,cis))(k,...)
308a.   (stow,tbu,tbl,sr,idx,finals,pos,ch)
308b. [k7]  || let msg [] { comm[{ci,cki}]? | cki∈ckis } in
308c.   conv_dir_handling(ci)(uis,ckis,kis,cis)(k,...)
308c.   (stow,tbu,tbl,sr,idx,finals,pos,⟨msg⟩^ch)(msg) end
308d. [k10] || conv_node_notification(ci)(uis,ckis,kis,cis)(k,...)
308d.   (stow,tbu,tbl,sr,idx,finals,pos,ch)
308d. [k10] || conv_edge_notification(ci)(uis,ckis,kis,cis)(k,...)
308d.   (stow,tbu,tbl,sr,idx,finals,pos,ch)
308e. [k12] || conv_comp_ack(ci)(uis,ckis,kis,cis)(k,...)
308e.   (stow,tbu,tbl,sr,idx,finals,pos,ch)
308f.   || conv_at_node(ci)(uis,ckis,kis,cis)(k,...)
308f.   (stow,tbu,tbl,sr,idx,finals,pos,ch)
308g.   || conv_on_edge(ci)(uis,ckis,kis,cis)(k,...)
308g.   (stow,tbu,tbl,sr,idx,finals,pos,ch)

```

<sup>80</sup>**Note:** This is the only message received by conveyors from contracting conveyor companies in this, the present transport domain model. For more realistic transport domain models there will, of course, be other such messages – but they deal, not with the *intrinsic* facets of transport (logistics) but with technology support, management & organization, human, and other facets – cf. Chapter 8 of my book [7].

## 21.3 Subsidiary Behaviours

### 21.3.1 Proactive Behaviours

#### 21.3.1.1 [k7] Directives

309. The `conv_directive_handling` behaviour for handling conveyor company to conveyor directives

- (a) updates the to-be-unloaded, the to-be-loaded and the finals attributes, and
- (b) resumes being a conveyor.

This conveyor directives handling action k7 is “matched” by the informs conveyors action k7 Sect. Conveyor Directives]20.3.3 on page 100; cf. formula lines 309 and 304c on page 100.

```

309. [k7] conv_dir_handling(ci)(me)(k,r)
309.      (stow,tbu,tbl,sr,idx,finals,pos,ch)
309.      ((cki,t,ci),ConvDir((t',ni,cnu,mis),(t'',nj,cnu,mis)),final) ≡
309a.      let tbu' = tbu ∪ [nj→tbu∪{cnu}], [we disregard t,t',t'']
309a.      tbl' = tbl ∪ [ni→tbl∪{cnu}], [we disregard t,t',t'']
309a.      finals' = upd_finals(finals,final) in
309b.      conveyor(ci)(me)(k,r)(stow,tbu',tbl',sr,idx,finals',pos,<dirs>^ch) end

309a.      upd_finals(finals,(ni,cnu,ki)) ≡ finals∪[ni→[ki→cnu]]

```

#### 21.3.1.2 [k10] Conveyor to Node and Edge Notifications

310. Conveyor notify the edges and nodes along which it is moving:

- (a) either at a node,
- (b) or on an edge.

This `conv_node_notification` action k10 is “matched” by the node action k10 Sect. Main Behaviour]24.3 on page 116; cf. formula lines 310a and 322b on page 116.

**value**

```

310. conv_node_notification(ci)(uis,ckis,kis,cis)(k,...)
310.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch) ≡
310a.      let msg = ((ci,record TIME(),ni),mk_AtNode(ni)) in
310a. [k10] comm[{ci,ni}]! msg ;
310.      conveyor(ci)(uis,ckis,kis,cis)(k,...)
310.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),<msg>^ch) end

```

This `conv_edge_notification` action k10 is “matched” by the edge action k10 Sect. Main Behaviour]24.3 on page 116; cf. formula lines 310b and 322d on page 116.

```

310. conv_edge_notification(ci)(uis,ckis,kis,cis)(k,...)
310.      (stow,tbu,tbl,sr,idx,finals,pos:mk_OnEdge(_,(_,ei),_),ch) ≡
310b.      let msg = ((ci,record TIME(),ei),mk_OnEdge(ei)) in
310b. [k10] comm[{ci,ei}]! msg ;
310.      conveyor(ci)(uis,ckis,kis,cis)(k,...)
310.      (stow,tbu,tbl,sr,idx,finals,pos,<msg>^ch) end

```

<sup>80</sup>The `ci` is that of the conveyor

<sup>79</sup>The two formal argument occurrences of `ci`, respectively `cki`, must be pairwise identical! See also the next `conv_msg_handling` definitions.

## 21.3.1.3 Conveyor on Edge

## Conveyor on Edge – Then:

```

1111  $\pi$ 30.    conveyor(ci)(cm)(k,routes)(cr,mk_OnEdge(nuif, (f,e),nuit),ch)  $\equiv$ 
1111a  $\pi$ 30.    conveyor_moves_on_edge(ci)(cm)(k,routes)(cr,mk_OnEdge(nuif, (f,e),nuit),ch)
1111c  $\pi$ 30.     $\sqcap$  conveyor_stops_on_edge(ci)(cm)(k,routes)(cr,mk_OnEdge(nuif, (f,e),nuit),ch)
1111b  $\pi$ 30.     $\sqcap$  conveyor_enters_node(ci)(cm)(k,routes)(cr,mk_OnEdge(nuif, (f,e),nuit),ch)

```

We leave it to the reader, this time, to review the functions: `conveyor_moves_on_edge` Sect. 7.4.1 items 112 on page 30 etc., `conveyor_stops_on_edge` Sect. 7.4.1 items 114 on page 31 etc. and `conveyor_enters_node` Sect. 7.4.1 items 113 on page 31 etc.

• • •

## Conveyor on Edge – Now:

311. An edge [behaviour] at an edge external non-deterministically either:

- (a) **moves** along the edge, a fraction “at a time”, or
- (b) **stops** on the edge and thereby “leaves” transport; or
- (c) **enters** a node.

```

311.    conveyor_on_edge(ci)(me:(uis,ckis,kis,cis))(k,len,cost)
311.    (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)  $\equiv$ 
311a.     $\sqcap$  conveyor_moves_on_edge(ci)(me:(uis,ckis,kis,cis))(k,len,cost)
311a.    (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)
311b.     $\sqcap$  conveyor_stops_on_edge(ci)(me:(uis,ckis,kis,cis))(k,len,cost)
311b.    (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)
311c.     $\sqcap$  conveyor_enters_node(ci)(me:(uis,ckis,kis,cis))(k,len,cost)
311c.    (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)

```

The next behaviour is “patterned” over Items 112a– 112e on page 30.

312. A conveyor which is moving along an edge, some fraction down the edge/road/track/route, but not “yet” near “the end”:

- (a) at time  $\tau$ ,
- (b) increments the fraction of its position
- (c) (while updating its history)
- (d) notifying the edge [behaviour]
- (e) [technically speaking] adjusting its position], and, finally,
- (f) resuming being a thus updated conveyor [OnEdge.

```

312.    conveyor_moves_along_edge(ci)(me)(__,__,__)
312.    (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)  $\equiv$ 
312a.    let  $\tau = \text{record\_TIME}()$ ,  $\varepsilon:\text{Real} \cdot 0 < \varepsilon \ll 1$  in
312b.    let  $f' = f + \varepsilon$ ,  $\text{cpos} = \text{mk\_OnEdge}(n_{ui_f}, (f',e), n_{ui_t})$  in
312c.    let  $\text{ch}' = \langle (\tau, ci) \rangle^{\text{ch}}$  in
312d.    comm  $\{ \{ ci, ej \} \} ! (\tau, ci)$  ;
312e.    conveyor(ci)(me)(__,__,__)
312f.    (stow,tbu,tbl,sr,idx,finals,mk_AtNode(tni),ch) end end end
312.    pre:  $f \simeq 1 \wedge \text{sr}(idx) = \text{tni}$ 

```

313. A conveyor may, “surreptitiously” as it were, “decide” to stop being a conveyor altogether !

```
313. conveyor_stops_on_edge(ci)(me:(uis,ckis,kis,cis))(k,len,cost)
313.      (stow,tbu,tbl,sr,idx,finals,mk_OnEdge((fni,(ej,f),tni)),ch)  $\equiv$  stop
```

314. A conveyor enters a node

- (a) at time  $\tau$ , by altering its position,
- (b) notifying both edge and node behaviours,
- (c) and resumes being a conveyor.

```
314. conveyor_enters_node(ci)(me)(_,_,_)
314.      (stow,tbu,tbl,sr,idx,finals,mk_OnEdge(fni,(ej,1),tni),ch)  $\equiv$ 
314.      let  $\tau = \text{record TIME}()$  in
314a.      (comm[{ci,ej}]! ( $\tau$ ,ci)||comm[{‘tau,tni}]! ( $\tau$ ,ci)) ;
314b.      conveyor(ci)(me)(_,_,_)
314b.      (stow,tbu,tbl,sr,idx,finals,mk_atNode(tni),⟨( $\tau$ ,mk_atNode(tni))⟩ch) end
```

#### 21.3.1.4 Conveyor at Node

**Conveyor at Node – Then:**

**value**

```
i105  $\pi$ 28. conveyor(ci)(cm)(k,routes)(cr,mk_AtNode(ni),ch)  $\equiv$ 
i105a  $\pi$ 28.      conveyor_change_route(ci)(cm)(k,routes)(cr,mk_AtNode(ni),ch)
i105b  $\pi$ 28.      || conveyor_remains_at_node(ci)(cm)(k,routes)(cr,mk_AtNode(ni),ch)
i105c  $\pi$ 28.      || conveyor_enters_edge(ci)(cm)(k,routes)(cr,mk_AtNode(ni),ch)
i105d  $\pi$ 28.      || conveyor_stops_at_node(ci)(cm)(k,routes)(cr,mk_AtNode(ni),ch)
```

• • •

**Conveyor at Node – Now:**

A primary “business” of a conveyor at a node is to unload and load merchandises.

315. In general, a conveyor at a node internal non-deterministically “alternates” between

- (a) **unloading** merchandises,
- (b) **loading** merchandises,
- (c) **stopping** altogether, and
- (d) **entering** a next edge – if not the end of the conveyor route –  
– an in these cases resuming being a conveyor.

```
315. conveyor_at_node(ci)(uis,ckis,kis,cis)(k,...)
315.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)  $\equiv$ 
315a.      conveyor_unloads_merch(ci)(uis,ckis,kis,cis)(k,...)
315a.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)
315b.      || conveyor_loads_merch(ci)(uis,ckis,kis,cis)(k,...)
315b.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)
315c.      || conveyor_stops_at_node(ci)(uis,ckis,kis,cis)(k,...)
315c.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)
315d.      || conveyor_enters_edge(ci)(uis,ckis,kis,cis)(k,...)
315d.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)
```

316. Conveyors unload (deliver), onto the node they are at,

- (a) from their stowage, the one-or-more contracted merchandises, for that node,
- (b) [k11a] and communicates these to that node,
- (c) [k12a] and acknowledges that to the contracting conveyor companies.
- (d) For final ‘unloads’, if any, receiving customers
- (e) are informed of pending delivery.
- (f) Whereupon the conveyor resumes being a conveyor at that node.

**value**

```

316. conveyor_unloads_merch(ci)(uis,ckis,kis,cis)(k,...)
316.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch) ≡
316a.      let unls = tbu(ni), stow' = stow\{ni} in
316b.      [k11a] comm[{ci,ni}]!mk_CNTransfer(stow/unls)80
316c.      [k12a] || {comm[{ci,xtr_CKI(ci)]!mk_Acknowledgment(record TIME(),cnu,(ci,ni))
316c.      | cnu:ContractNu·cnu∈unls } ;
316d.      if ni∉dom finals
316d.      then skip
316e.      else { let cnu=(finals(ni))(ki), mis=(tbu(nu))(cnu) in
316e.      [k13] comm[{ci,ki}]!mk_PendDeliv(ni,(cnu,mis)) ;
316e.      | ki:KI·ki∈dom finals(ni) end }
316d.      end
316f.      conveyor_unloads_merch(ci)(uis,ckis,kis,cis)(k,...)
316f.      (stow',tbu\{ni},tbl,sr,idx,finals\{ni},mk_AtNode(ni),⟨v⟩^ch) end

```

**Alert:** Fix **v**: CNTransfer(unls) ?

317. Conveyors load (fetch)

[from the node they are at, onto their stowage]

contracted merchandises:

- (a) if there are merchandises to
- (b) load these
- (c) communicate them to the node
- (d) and the contracting conveyor company notified.
- (e) otherwise nothing is done;
- (f) and the conveyor resumes being a conveyor at that node.

**value**

```

317. conveyor_loads_merch(ci)(uis,ckis,kis,cis)(k,...)
317.      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch) ≡
317a.      if ni∈dom tbl
317b.      then let lds = tbl(ni), cki = xtr_CKI(cnu) in
317c.      comm[{ci,ni}]!mk_NCTransfer(lds) ;
317d.      comm[{ci,cki}]!mk_Acknowledgment(cnu,(ci,ni)) end
317a.      else skip end
317f.      conveyor_loads_merch(ci)(uis,ckis,kis,cis)(k,...)
317f.      (stow,tbu,tbl\{ni},sr,idx,finals,mk_AtNode(ni),⟨load⟩^ch)

```

**Alert:** Check for proper **load** onto ch

<sup>80</sup>The value of stow/unls is that of stow [domain-]restricted to unls.

The next behaviour:

**value**

```
conveyor_stops_at_node(ci)(uis,ckis,kis,cis)(k,...)
      (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)  $\equiv$  stop
```

is a “mere” transcription” of the similarly named behaviour of Sect. 7.4.1 on page 28, items 114 on page 31-... .

318. Finally, the conveyor may [be ready to] leave the node for possibly continuing its journey.

- (a) If the conveyor is at the end of its current service route,  $sr$ ,
- (b) then
- (c) it reverts  $sr$ , into  $rs$ ,
- (d) which defines the next  $mk\_onEdge(fni, (0,ei), tni)$  elements,
- (e) and the conveyor continues being a conveyor, on that edge.
- (f) Otherwise
- (g) the next  $mk\_onEdge(fni, (0,ei), tni)$  elements, are defined by the current service route,  $sr$ ,
- (h) and the conveyor continues being a conveyor, on that edge.

```
318. conveyor_enters_edge(ci)(me)(k,...)
318.   (stow,tbu,tbl,sr,idx,finals,mk_AtNode(ni),ch)  $\equiv$ 
318a.   if  $idx = len\ sr$ 
318b.     then
318c.       let  $rs = revert(sr)$  in
318d.       let  $fni = rs[1], ei = rs[2], tni = rs[3]$  in
318d.       let  $e = mk\_onEdge(fni, (0,ei), tni)$  in
318e.       conveyor(ci)(me)(k,...)
318e.       (stow,tbu,tbl,rs,1,finals,e,⟨e⟩ch) end end end
318f.     else
318g.       let  $fni = sr[idx], ei = sr[idx+1], tni = sr[idx+3]$  in
318h.       let  $e = mk\_onEdge(fni, (0,ei), tni)$  in
318h.       conveyor(ci)(me)(k,...)
318h.       (stow,tbu,tbl,sr,idx+1,finals,e,⟨e⟩ch) end end
318f.   end
```

```
318c. revert: Path  $\rightarrow$  Path
318c. revert(p)  $\equiv$ 
318c.   case  $p$  of
318c.      $\langle \rangle \rightarrow \langle \rangle,$ 
318c.      $r^{\langle u \rangle} \rightarrow \langle u \rangle^{\wedge} revert(q)$ 
318c.   end
```

The above reflects but one choice for continuing a conveyor once it has “exhausted” its current service route. Others can be thought of.

## **Chapter 22**

# **Logistics Company Behaviour**

We skip this chapter: the conveyor company behaviour “says it all !”.

# Chapter 23

## Edge Behaviour

### Contents

```

### 24.2 Revised Node Attributes

320. Each node may potentially provide [also] as a temporary “on-hold” storage for customer merchandises.

#### type

```
320. OnHold = ContractNu  $\xrightarrow{m}$  M-set
```

#### value

```
320. attr_OnHold: N  $\rightarrow$  OnHold
```

## 24.3 [k10,k11,k14] Main Behaviour

321. Node behaviours revolves around:

322. nodes external non-deterministically accepting messages from conveyors where these messages are

- (a) [k10] either notifications of the presence of (moving) conveyors – duly recorded in the node history attribute;
- (b) [k11a] or from conveyors unloading at nodes duly updated in the node onhold and history attributes;
- (c) [k11b] or from conveyors loading at nodes
- (d) [k12] and informing the “originating” conveyor company,  
– in which latter case
- (e) the merchandises identified in the load are communicated (“back”) to the conveyor.

or non-deterministically externally receiving requests from customers to

323. to deliver contracted onhold merchandises,

```

321. node(ni)(nm:(eis,kis,cis))(nkind)(onhold,nh) ≡
322.   let msg = [] {comm[{ni,ci}]? | ci:CI.ci∈cis} in
322.   case msg of

322a.   [k10]   (_,mk_AtNode(ni))
322a.         → node(ni)(nm)(nkind)(onhold,⟨msg⟩nh),

322b.   [k11a] ((ci,τ,ni),mk_CNTransfer(cnu,lds)) [cf. 316b on page 109]
322b.         → node(ni)(nm)(nkind)(onhold∪lds81,⟨msg⟩nh),

322c.   ((ci,τ,ni),mk_NCTransfer(cnu,mis)) [cf. 317a on page 109]
322d.   [k12]   → let ms = {m:M.m∈onhold(cnu)∧uid_M(m)∈mis} in
322e.   [k11b]   comm[{ni,ci}]!mk_NCTransfer([cnu→ms]) ;
322d.         node(ni)(nm)(nkind)(onhold\cnu,⟨msg⟩nh) end

322.   end end

323.   [] let msg:mk_PendColl(ni,(cnu,mis)) = [] {comm[{ni,ki}]? | ki:KI.ki∈kis} in
323.   let ms = {m|M.m∈onhold(cnu)∧uid_M(m)∈mis} in
323.   let τ = record TIME() in
323.   msg = ((ni,τ,ki),mk_NKTransfer(ms)) in
323.   [k14] comm[{ni,ki}]! msg ;
323.   node(ni)(nm)(nkind)(onhold\cnu,⟨((ni,τ,ki),ms_to_mis(ms))⟩nh) end end
116.   end

```

## Discussion

### Contents

25.1 Wither Logistics Companies	119
25.2 Some Parts Modelled, Others Not!?	120
25.3 Formal Structuring	121
25.4 Mnemonics	121
25.5 Narratives	121

### 25.1 Wither Logistics Companies

It was a mistake, it seems, to distinguish between conveyor and logistics companies. A conveyor company with no conveyors is a logistics company. Examples are travel agencies. A revised taxonomy for conveyor companies is as shown in Figs. 25.1 and 25.2 on the following page. They are revisions of Figs. 12.1 on page 52 and 9.1 on page 37.

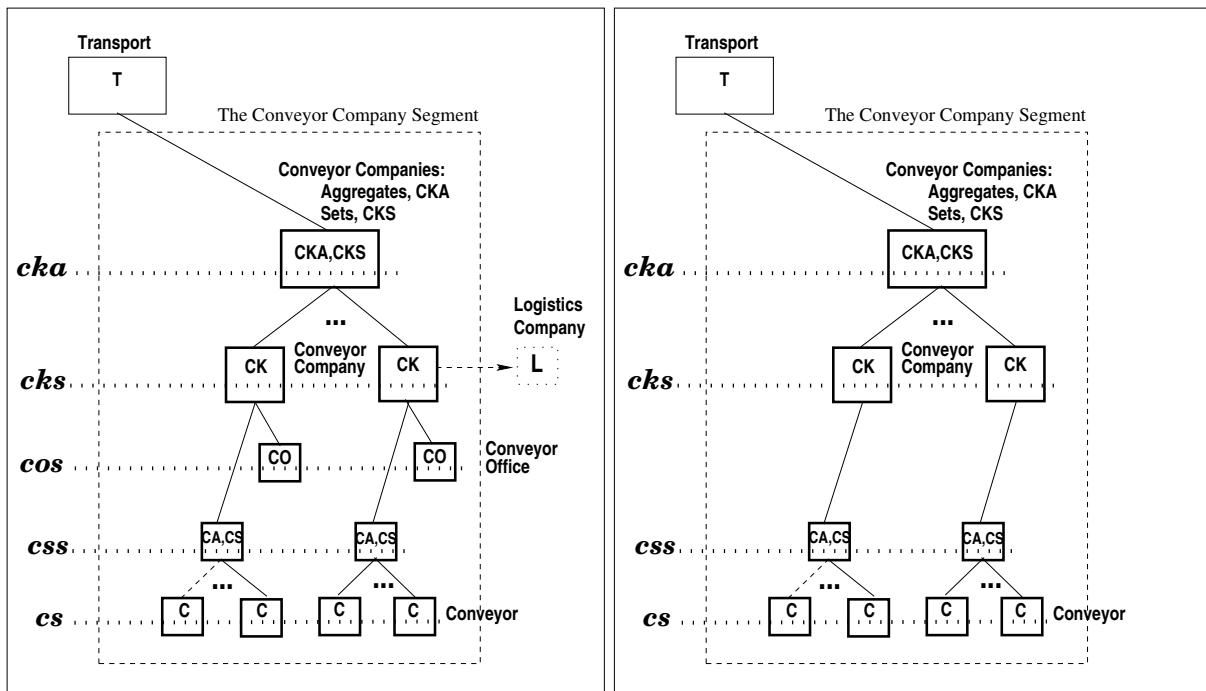

Figure 25.1: Old and Revised Conveyor Company Taxonomies

The corresponding Command & Material Traces figures is Fig. 25.3 on the next page:

MORE TO COME

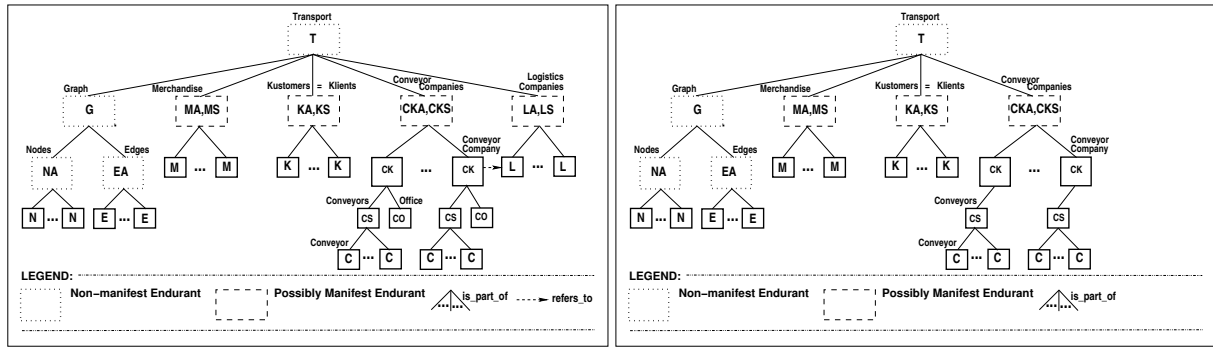

Figure 25.2: Old and Revised Transport Taxonomies

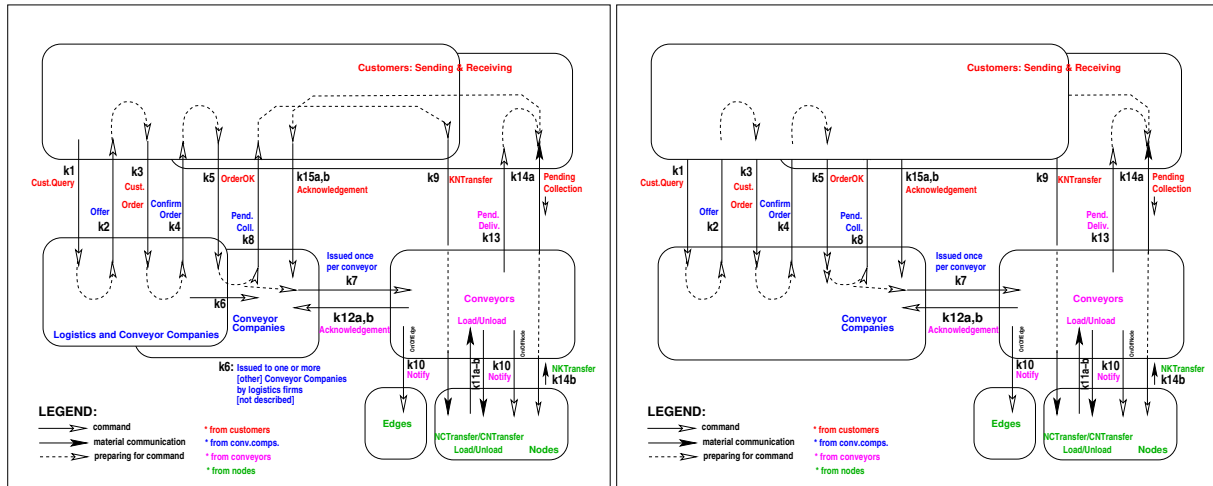

Figure 25.3: Old and Revised Command &amp; Material Traces [→]

## 25.2 Some Parts Modelled, Others Not ! ?

The reader will have observed that we model only some of the internal qualities of composite parts ! Why ? Well the answer is this: We have chosen to emphasize the modelling of essential aspects of transport. The “omitted” full modelling of some, well most, composite parts [endurants], and hence their behaviours [perdurants], is therefor motivated as follows:

- **Graphs:** With G, EA and NA we do not associate any manifest “authority”. But we could ! ? With G we could associate such more-or-less public authorities as the road authorities of Your city or country, rail net authorities, coastal and sea authorities, air traffic command & control, incl. ICAO <sup>82</sup>, etc.
- **Merchandise Aggregate:** With MA we also do not associate any manifest “authority”. But we could ! ? There are an abundance of private/public association which monitor and control publically available merchandise categories: food, toy, automobile, etc., agencies.
- **Customer Aggregate:** With KA we do not associate any manifest “authority”. But we could ! ? We leave it to the reader to identify possibly relevant such candidates !
- **Conveyor Companies Aggregate:** With CKA we do not associate any manifest “authorities”. But we could ! ? There are public/private associations which handle concerns of the conveyor industry, one or more for each kind. We omit their modelling.
- **Logistics Companies Aggregate:** With LA we do not associate any manifest “authorities”. We could ! ? But we do not.

<sup>82</sup><https://www.icao.int/about-icao/Pages/default.aspx>

## 25.3 Formal Structuring

By *formal structuring* we mean the way we have chosen some endurant parts to be composite, i.e., Cartesians and sets of parts. This structuring is most clearly reflected in Fig. 9.1. We now regret the “messy” handling of logistics, both as separate parts, and as an element of conveyor companies. A better “decomposition” must be found in a continuation project. There are other, in our mind, minor, such restructurings to be made.

## 25.4 Mnemonics

Mnemonics is the study and development of systems for improving and assisting the memory<sup>83</sup>. One such system is naming. We have strived some “logic” in choosing names. Endurant parts have been given very short one, two or three letter identifiers. Commands, functions and behaviours have been assigned longer identifiers, trying to compress their full names in the informal texts. A careful review, for any possible continuation project should carefully review these latter names.

## 25.5 Narratives

All (or almost all) **formulas** have been preceded by **narratives**. Pairwise their numbering “match”! But these narratives are, in our mind, far from satisfactory. Much more care should be taken in formulating and “repetitively” express these narratives. Perhaps one should serve two narratives for each one presented here? One, short, coupled with and receding the formulas; another, longer, perhaps appearing as footnotes, or as notes in a separate appendix?

Chapters 2–24 (pages 7–116) sketched a “strict” narrative coupled to a formal description of an essence of transport domains. These were engineering descriptions. Your understanding of these rely on Your having understood [12, 9, 7, 6, 4].

### 26.1 Logistics & Operations Research

As for ‘logistics companies’: Yes, I have left them out.

#### 26.1.1 Logistics

324. By *logistics* we shall mean *the detailed planning of the organization and implementation of a complex operation*..

In this report logistics, in this sense of *planning* has been concentrated in the function `cal_offer`, cf. Item 302a on page 99.

#### 26.1.2 Operations Research

That is: the often exciting and beautiful properties of optimization algorithms are to be “buried” here. They do not belong to the ‘transport’ aspects – but to the *strategic, tactical an operational facets* of the transport domain<sup>84</sup>.

### 26.2 Interpretations

The domain description of Sects. 2–18 (pages 7–116) can be viewed in three ways:

- (i) as a step in the general, say socio-economic study of a specific infra-structure [sub-]domain;
- (ii) as a prerequisite for *business process re-engineering*;

<sup>84</sup>Cf. Sect.8.7, Example 107, pages 232–233 of my book [7].

- (iii) as an, albeit, in this case, and this stage of unfolding study, basis document for preparing teachers material for subsequent development, i.e., writing, of secondary school course element for teaching such specific infra-structure [sub-]domains; and
- (iv) as an initial feasibility study for possible subsequent development of software for multi-mode transport systems.

We shall now comment on each of these.

### 26.2.1 Socio-Economic Study

TO BE WRITTEN

### 26.2.2 Business Process Re-Engineering

TO BE WRITTEN

### 26.2.3 Primary and Secondary School Topic

We should like to see reports on the study, analysis and description of several societal infrastructure components:

- **the banking system**, from Your local, “brick and mortar” branch office via its head quarter, the national bank of Your country<sup>85</sup>, the regional bank of your continent to The World Bank<sup>86</sup> and the IMF<sup>87</sup>;
- **the insurance industry**;
- **the health care industry**, from Your family doctor, via local clinics, to hospitals – with pharmacies, home care and health insurance providers included;
- **the education system**, from primary and secondary schools, to high schools, colleges and universities;
- **et cetera !**

### 26.2.4 Algorithms & Data Structures

Many functions, like `get_offers`, imply, for their software realization, rather complex data structures and intricate algorithms. Since we are describing domains, and not designing software. we need, in a sense, not be concerned. But we have achieved, one might say, a clear identification, of where such clever software designs may be warranted.

### 26.2.5 Software System Development

This study and experimental report began with espousing **The Triptych Dogma**. But we have advocated that domain modelling be used for other purposes than “just” software development. Now we “*return to the fore*”! We now assume that there is, indeed, to be professionally & commercially, at least in a seriously funded effort, to be developed actual software for essential aspects of transport as they have been laid out in this study and experimental report. How would we go about doing that ?

Based on more than 40 years of experience<sup>88</sup> we would do as follows:

- First we would, as we have already started doing, perform the three phases of so-called ‘ ‘SEA’ ’ preparatory work.
  - **Study**,
  - **Analyze**, and
  - **Experiment**.

We have just, more-or-less, completed these three phases.

- Now we are ready for a project committed to produce a “full-blown” domain model.

<sup>85</sup><https://www.nationalbanken.dk/en>

<sup>86</sup><https://www.worldbank.org/ext/en/home>

<sup>87</sup><https://www.imf.org/en/Home>

<sup>88</sup>We refer to the Dansk Datamatik Center’s [17] CHILL and Ada projects [18]

- After that, the similar development of a requirements prescription.
- And after that, the development of a software design, is coding, validation, etc.

How would we organize the “full-blown” domain modelling

- First we would assemble, in this case, six people, well-familiar with the domain modelling approach pursued in this report.
- They would be organized with the following responsibilities – being responsible for the development of:
  - the transport net, i.e., graph, model – 1 person;
  - the conveyor model – 2 persons;
  - the merchandises model – 1 person; and
  - the logistics and conveyor companies model – 2 persons.

All under the leadership of an overall domain modelling “architect” !

They would each have “an own”, private and “inviolable” office. After a very few days of domain modelling they would

- each morning review the previous day’s work of a colleague, on a rotating shift basis, a “new colleague” on consecutive days;
- meet around a coffee/tea machine and a white board mid-morning for the possible discussion of common issues – across their modelling – while also handing back the possibly annotated work of their reviewed colleague;
- go back to correcting possible collegial remarks;
- and otherwise continue their main assigned work !

## 26.3 Formality and Verification

**Jean-Raymond Abrial**<sup>89</sup> passed away 26 May 2025. He was one of the greats of our science. His contributions, especially through *Z*, *B* and *The B Methods* [2, 1] to *construction by proof* are seminal.

So where, in our description, do we find “traces” of that ?

The answer is: nowhere !

Why ?

Well, usually proof of program correctness is usually [carried out] with respect to some property, some “prior” specification. For domains there is no prior “specification” ! There is the manifest reality of the subject domain.

Thus we must first specify, i.e., describe that domain.

A domain description, a domain model, cannot be said to be correct.

It is either a bad, or a not so bad, or not quite so “approximate” a description as to be accepted by domain stakeholders; or it is a reasonably good model.

Verification of a domain model is by its acceptance by domain stakeholders.

When, below, we refer to verification we mean that properties of the description can be expressed, in mathematical logic and then formally proved: verified, tested, checked !

• • •

**But:** But the above is not good enough ! Certainly J.R. Abrial’s work must or ought apply here ! ? A study should be made, by professionals well-familiar with, for example, Event B<sup>90</sup>. Based on the description/modelling taxonomy, cf. Fig. 2.1, it might very well be possible to formulate the formal model along the principles set out by J.R. Abrial

• • •

The next remarks were written before the J.R. Abrial discourse above.

• • •

<sup>89</sup>[https://en.wikipedia.org/wiki/Jean-Raymond\\_Abrial](https://en.wikipedia.org/wiki/Jean-Raymond_Abrial)

<sup>90</sup><https://www.event-b.org/>, <https://www.southampton.ac.uk/~tsh2n14/publications/chapters/eventb-dbook13.pdf>

The reader may well have observed two aspects of our “formal” model:

- (i) **“Formality” of the Specification:** I have been rather “lax”, some would say, in my use for RSL. An example is “trick”, referred to in footnote 67 on page 95, and used in several formal parameter of behaviours. Other examples is the use of discriminated union of `:`-defined command types. These “lax” uses have been done, deliberately, in the interest of shortening the formulas. They can all be edited into “correct” RSL.
- (ii) **Lack of Verification:** Yes, indeed. I have not been as careful as I would wish, to highlight all the places where appropriate **theorems** should be enunciated, let alone proved. Similarly for **axioms**. I trust the reader can spot these places. And I trust that appropriate proofs be provided. Not necessarily formal proofs in the sense of there being a proof system for the RSL for all of these cases: there is not. But then I am “almost” sure that classical proofs, such as mathematicians “always” do, can suffice. And, for cases that that is not immediately possible ? Well, great, then this domain description provides rich possibilities for the able computer scientist to excel !

## 26.4 On the Development of This Model

I started on this document on Saturday February 22, 2025. I finished, “more-or-less” all the formalization and this concluding section on Monday March 3, 2025. Nine days, Nine days of great fun.

I am not really ashamed to confess that other than the RSL formula text editing system I have not had access to proper RSL tools, such as they indeed do exist. Thus I have not been able to more-or-less automatically check my RSL formulas. Et cetera - et cetera !

During the development many model-formulations changed. Figure 16.1 on page 72, for example, underwent numerous versions.

### B.2 Mereologies and Attributes

#### B.2.1 Customers

##### Mereology:

ι168 π48.  $KM = MI\text{-set} \times (CKI|LI)\text{-set} \times CI\text{-set}$

##### Attributes:

```
ι169 π48. CustId = CustNam × CustAdd × ...
ι170 π48. Possess = MI-set
ι171 π48. OutReqs = ...
ι172 π48. CustHist = (TIME × Event)*
ι173 π48. Event = ...
ι174 π48. ...
```

### B.2.2 Conveyor Companies

#### Mereology:

!192  $\pi 54$ .  $CAM = CI\text{-set} \times COI$

#### Attributes:

!201  $\pi 56$ .  $ConvCompInfo = \dots$

!203  $\pi 56$ .  $Contracts = ContractNu \xrightarrow{m} Move^*$

!203a  $\pi 56$ .  $Move = (KI \times NI) | (NI \times CI) | (CI \times NI) | (NI \times KI)$

!204  $\pi 56$ .  $Orders = ContractNu \xrightarrow{m} Offers$

!204a  $\pi 56$ .  $ContractNu$

!204b  $\pi 56$ .  $Offers = ChoiceNu \xrightarrow{m} TR$

!204c  $\pi 56$ .  $ChoiceNu$

!205  $\pi 56$ .  $CurrBuss = MSG\text{-set}$

!206  $\pi 56$ .  $PastBuss = MSG\text{-set}$

!207  $\pi 56$ .  $CKHist = MSG^*$

### B.2.3 Conveyors

#### Mereology:

!210  $\pi 59$ .  $CM = (NI|EI)\text{set} \times CKI\text{-set} \times KI\text{-set}$

#### Attributes:

!211  $\pi 60$ .  $Kind$

!212  $\pi 60$ .  $Stowage = ContractNu \xrightarrow{m} M\text{-set}$

!215  $\pi 60$ .  $TBU, TBL = NI \xrightarrow{m} ContractNu\text{-set}$

!213  $\pi 60$ .  $SR = Path$

!214  $\pi 60$ .  $SRIndex = Na$

!216  $\pi 60$ .  $Finals = NI \xrightarrow{m} (KI \xrightarrow{m} ContractNu)$

!216  $\pi 60$ .  $Final = NI \times ContractNo \times KI$

!217  $\pi 60$ .  $CPos = OnEdge (= NI \times (F \langle \rangle EI) \times NI)$

!217  $\pi 60$ .  $CPos = AtNode (= NI)$

!219  $\pi 60$ .  $CHist = MSG^*$

### B.2.4 Nodes and Edges

#### Mereology:

!42  $\pi 14$ .  $NM = EI\text{-set axiom } \forall nm:N M \cdot \text{card } nm > 0$

!43  $\pi 14$ .  $EM = NI\text{-set axiom } \forall em:E M \cdot \text{card } em = 2$

#### Attributes:

!55  $\pi 18$ .  $NodeKind = Kind\text{-set axiom } \forall nk:NodeKind \cdot nk \neq \{\}$

!56  $\pi 18$ .  $EdgeKind = Kind\text{-set axiom } \forall ek:EdgeKind \cdot \text{card } ek = 1$

!57  $\pi 18$ .  $LEN = \text{Nat}$

!58  $\pi 18$ .  $COST = \text{Nat}$

!320  $\pi 115$ .  $OnHold = ContractNu \xrightarrow{m} M\text{-set}$
